

1. If you have access to a facial tissue, blow your nose before the test.
2. Wash your hands and only hold the end of the swab opposite the soft swab tip.
3. Tilt your head back and fully insert the soft swab tip straight back (not up) into your nose until you hit resistance (up to 2.5 cm*). Make sure the soft swab tip is fully inside the nose.
4. Rotate the swab several times against the wall of the nose and let it sit for a few seconds to absorb nasal secretions.
5. Remove the swab from your nose and using the same swab, repeat for the other nostril.
6. Immediately place the swab into the test tube following the kit instructions.

**Swab insertion distance may differ for paediatric patients. Inserting the swab only up to the anterior nares (less than 1 cm) is discouraged.*
