What’s New in Group A streptococcus (GAS) and Invasive GAS Disease Research in Ontario

Disclaimer

This presentation was created by its authors. It will be published on the Public Health Ontario (PHO) website for public use as outlined in our Website Terms of Use.

PHO is not the owner of this content. Any application or use of the information in this document is the responsibility of the user.

PHO assumes no liability resulting from any such application or use.

Learning objectives

1. Describe epidemiology of invasive and non-invasive Group A Streptococcus (GAS) in children
2. Describe recent changes in the incidence of iGAS in Toronto and the Peel region
3. Review the incidence and epidemiology of iGAS in homeless persons
4. Determine the viability of whole genome sequencing to differentiate invasive from non-invasive GAS clinical isolates

Comparison of pharyngeal and invasive isolates of *Streptococcus pyogenes* by whole genome sequencing

Joseph Zeppa

Clinical Microbiology Fellow (PGY2)

Department of Laboratory Medicine and Pathobiology

University of Toronto

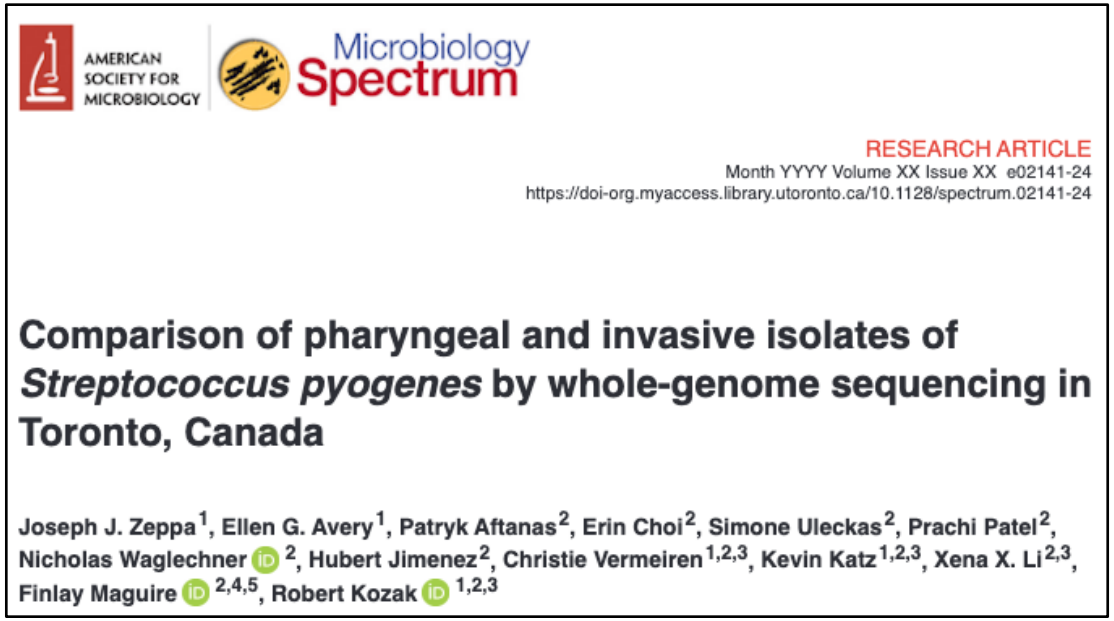
Conflicts of Interest/Disclosures

- None

Overview

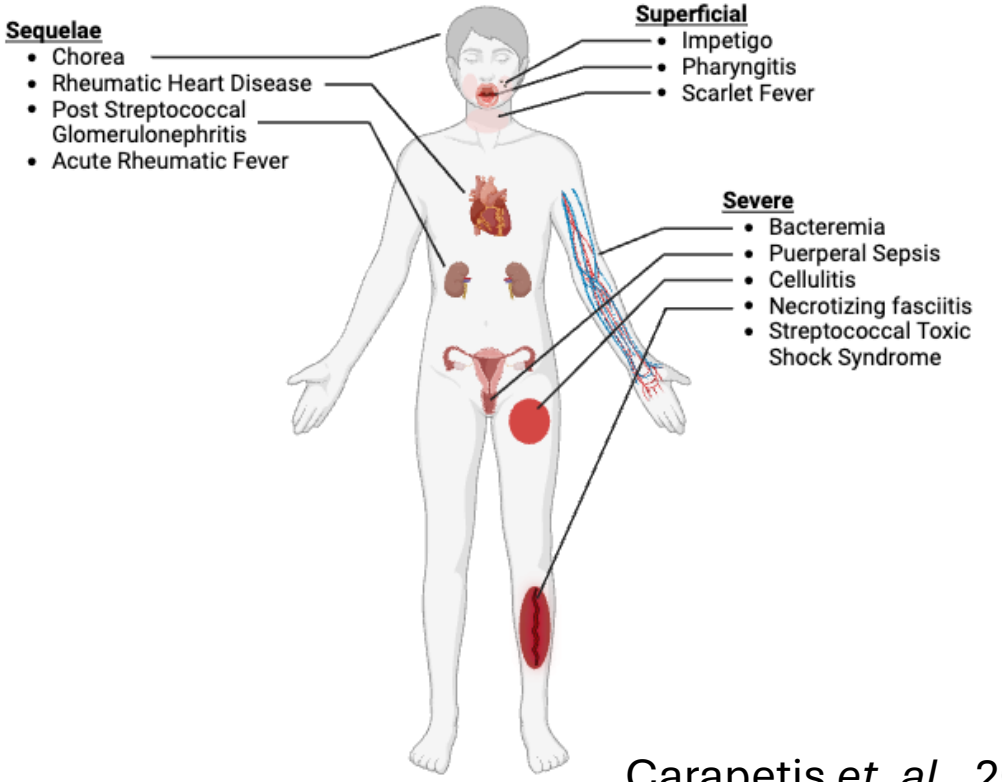
- Background on Group A Streptococcus (*S. pyogenes*)

- Findings from our recently published study:



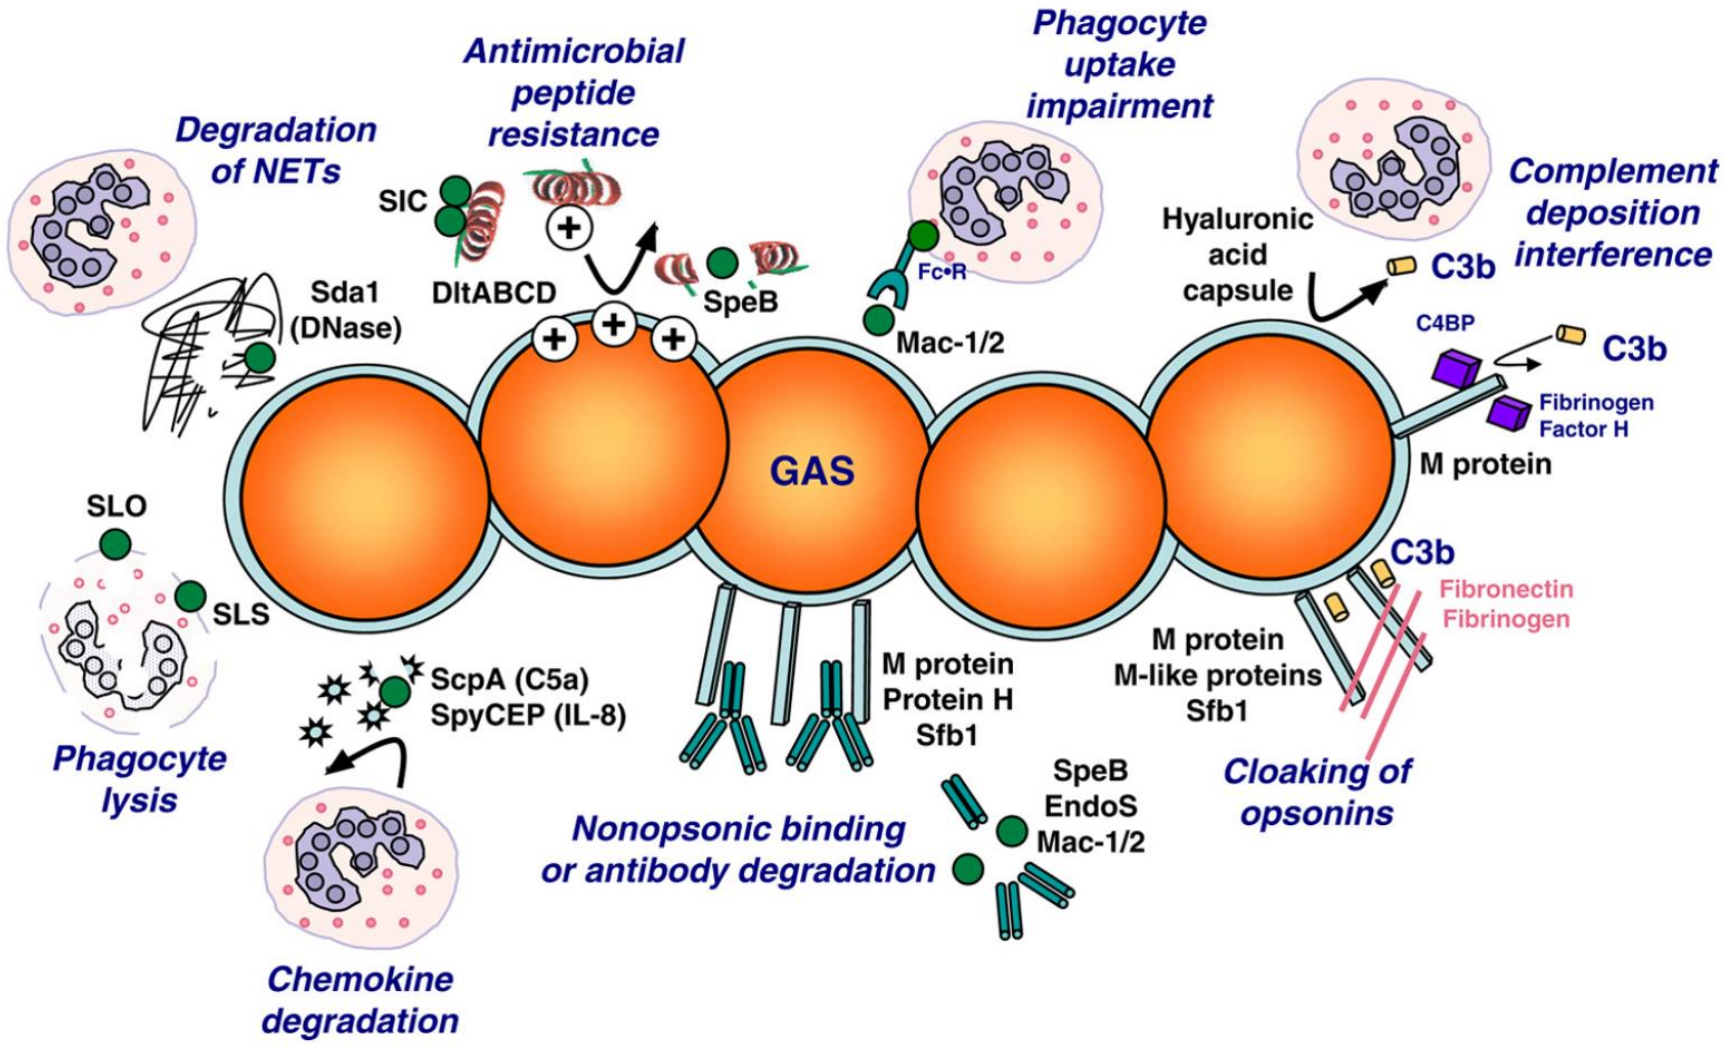
Streptococcus pyogenes

- Gram-positive, human restricted pathogen
- Capable of infecting/colonizing almost any tissue in the body
- Causing a wide variety of disease manifestations
  - Asymptomatically colonizes ~12% of school-aged children
  - 600 million cases of pharyngitis
  - 100 million skin infections
  - **500,000 deaths/year**



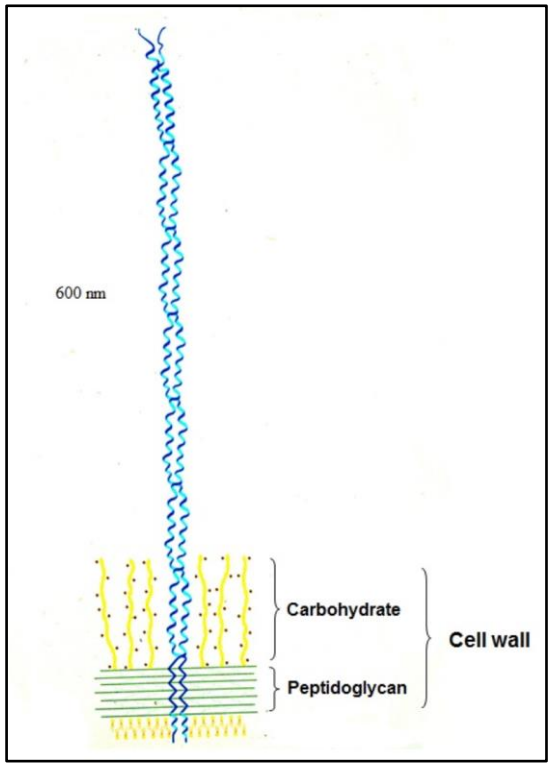
Carapetis *et. al.*, 2005
Shaikh *et. al.*, 2010

Group A Streptococcus Virulence Factors



Walker *et. al*. 2014

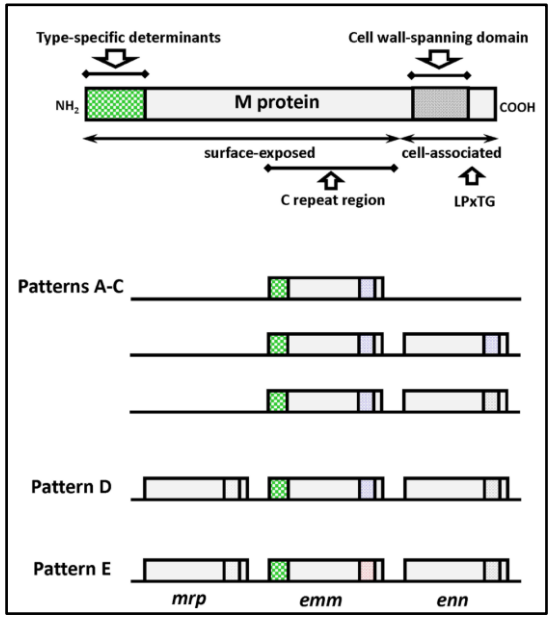
M protein and GAS typing



M protein

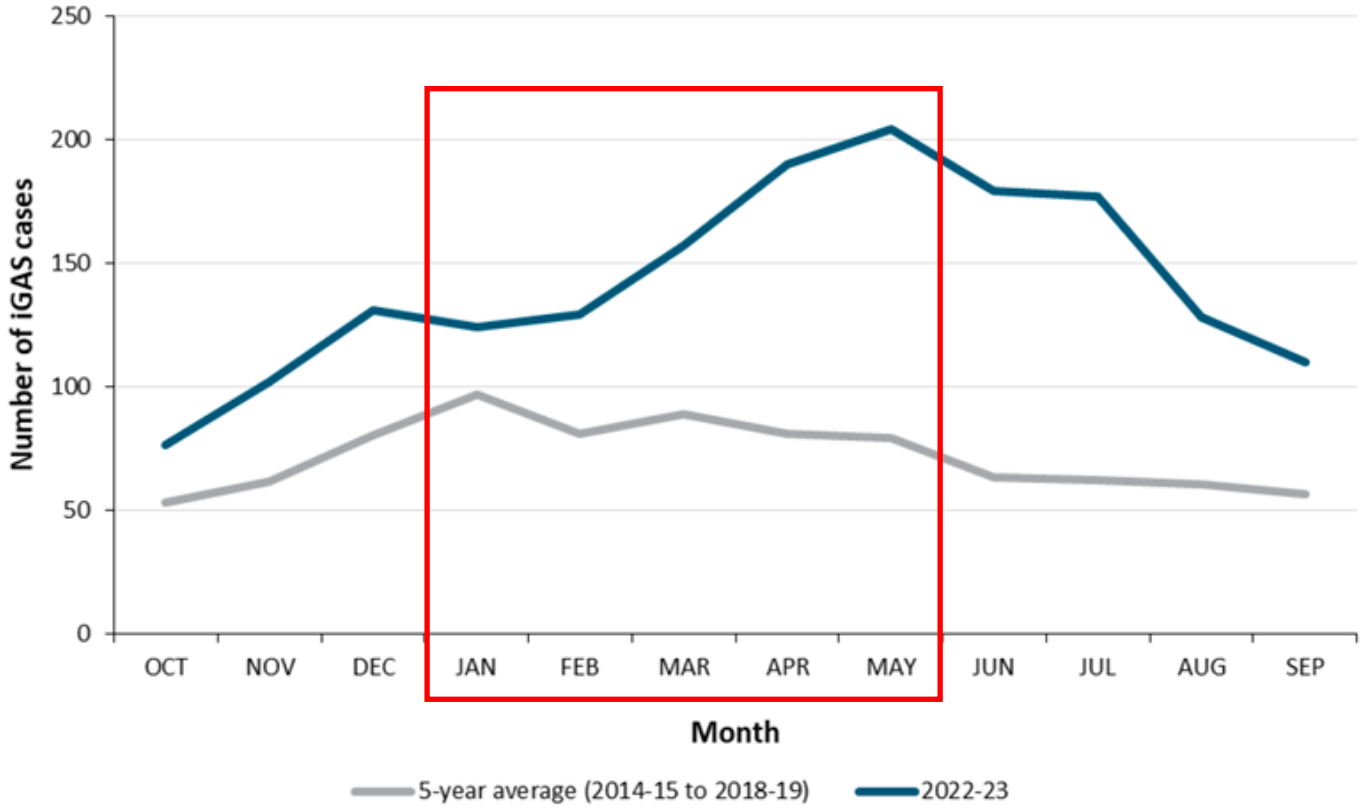
- Surface bound, antiphagocytic virulence factor
- Used in typing:

Scheme	Method	Number
M serotyping	• Immunoprecipitation using rabbit serum	>80
emm typing	• Sequencing first 30 codons (90 bp) of mature M protein • >92% similarity = same *emm* type	> 275
emm subtyping	• Sequencing first 50 codons (150bp) of mature M protein plus 10 terminal COOH codons (30bp) = 180bp • Any change to 180bp sequence = new *emm* subtype	>1900



Ontario, Canada – 2022 - 2023

Figure 2. Confirmed iGAS case counts by month: 2022-23 season (October 1, 2022 – September 30, 2023) compared to five pre-pandemic seasons (October 1, 2014 – September 30, 2019)



Data source: Ontario. Ministry of Health; 2024.[4]

Can we use whole genome sequencing to determine if there is a genomic change that can account for this trend?

Methodology

① **Sample Collection**
January - May, 2023

Non-Invasive (Throat)

N = 117

Invasive (Blood)

N = 38

② **Isolate Bacteria**

Conclusion

WGS: both invasive and non-invasive isolates represented across a diverse set of lineages

Invasive

*emm12** = 26.36%

emm49 = 23.68%

emm1 = 13.16%

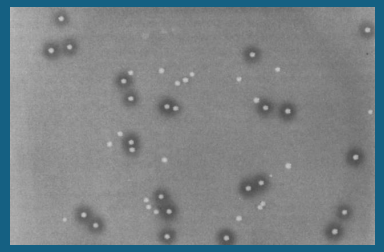
Non-Invasive

*emm12** = 70.09%

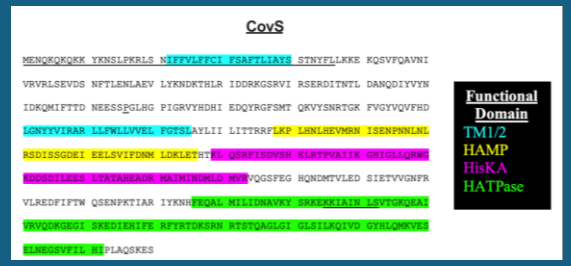
Differing prevalence of SAg, DNases and single VF/Adh.

More prominent in NON-INVASIVE isolates		
VF	SAg	*speC*
		ssa
		smez
	DNase	*spd1*
	Other	*hylP*
		endoS
		grab
Adhesion	FBP	*sfbI*
		prtF2

More prominent in INVASIVE isolates		
VF	M-like	*enn*
		mrp
	SAg	*speA*
	Other	*ideS/Mac*
Adhesion	FBP	*fbaA*
		fbaB



Non-Invasive isolates produced more lytic and proteolytic factors



Only Invasive isolates had mutations in *covS* gene

Future Directions

- Expand sample population to increase sample numbers and strengthen analyses
- Gather patient data to integrate host factors into overall findings
- Assess virulence factor/adhesin transcription/production using additional assays:
  - RNA sequencing
  - Assess protein production via Western blot/multiplex assay
  - *in vivo* animal models
- Phenotypic AST testing of isolates

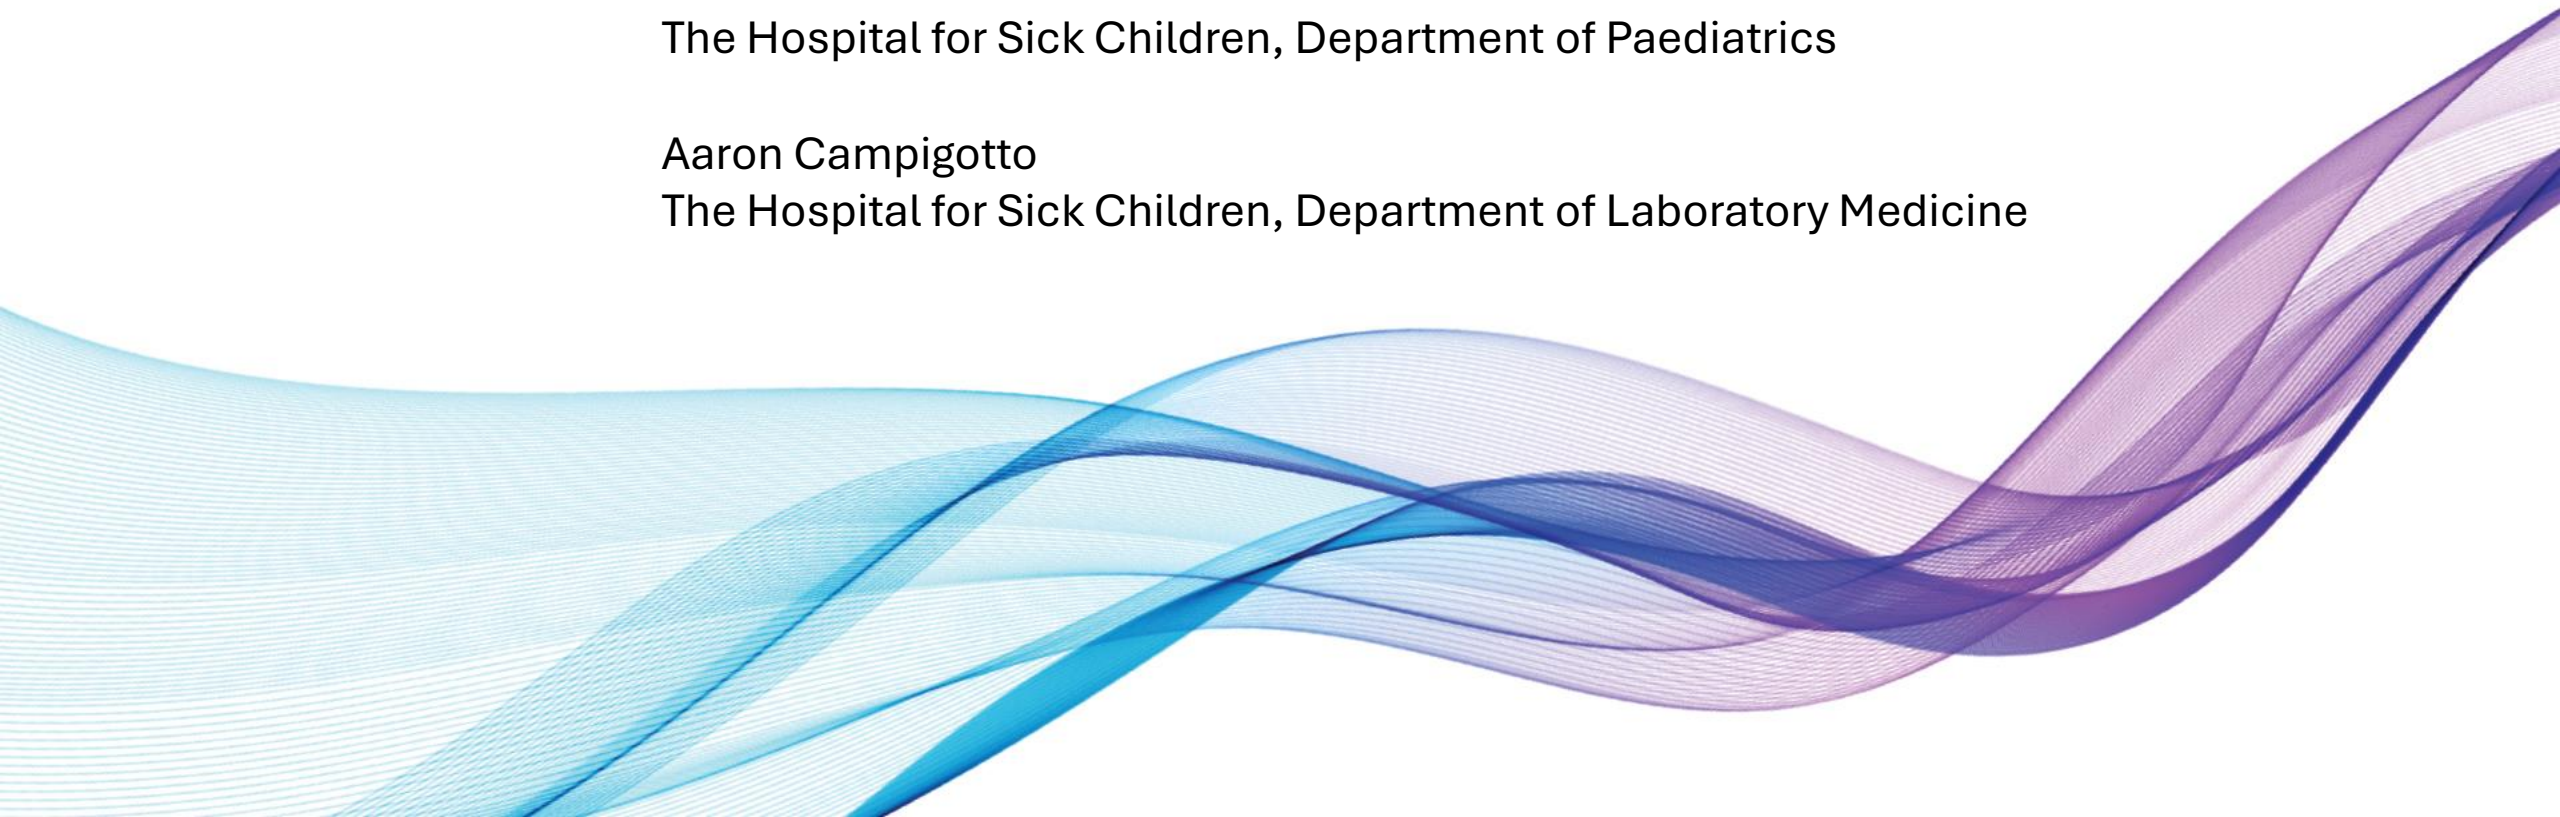
Group A Streptococcus in Children: A comparison of invasive and non-invasive isolates

Michelle Science
The Hospital for Sick Children, Department of Paediatrics

Aaron Campigotto
The Hospital for Sick Children, Department of Laboratory Medicine



Learning objectives

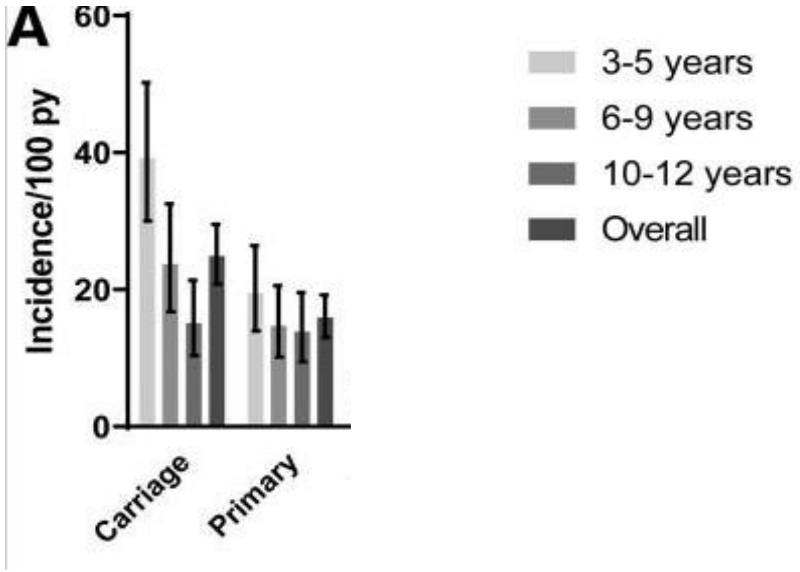
Describe epidemiology of invasive and non-invasive Group A Streptococcus (GAS) in children

1. Understand the clinical presentations of invasive and non-invasive GAS disease

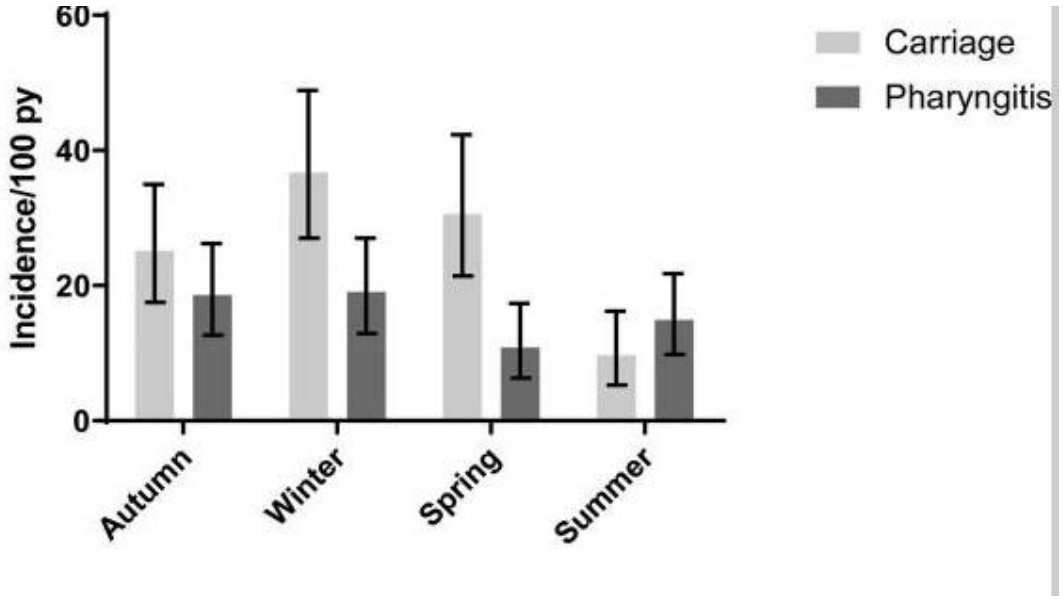
2. Understand circulating GAS *emm* types in this population and describe the *emm* types based on invasive and non-invasive clinical presentations

Colonization of GAS in children: Potential confounder?

- Colonization of GAS within the pharynx in up to 20% of children



- Seasonality present when assessing for colonization



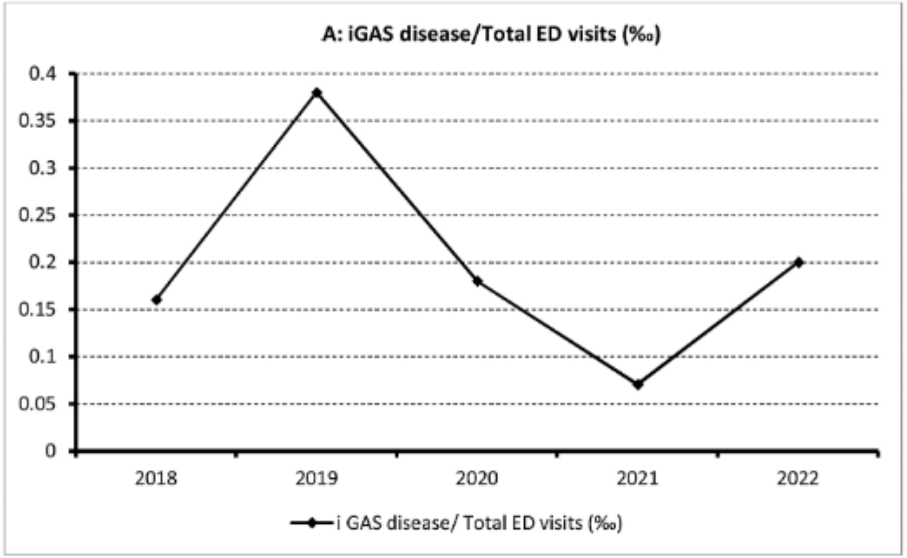
Frenck et al, PIDJ 2023

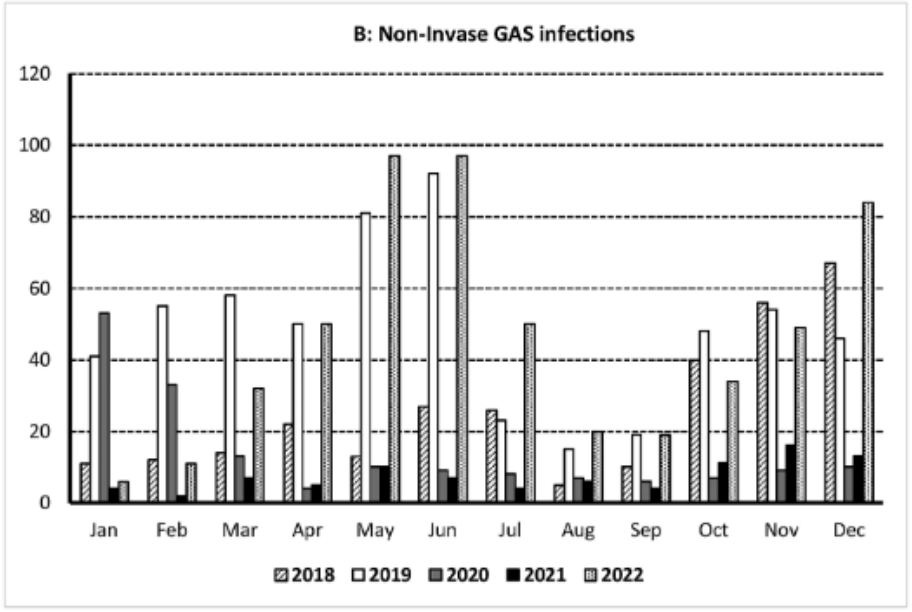
Prevalence of non-invasive GAS disease in children

Difficult to estimate given lack of reporting system and common clinical presentations including:

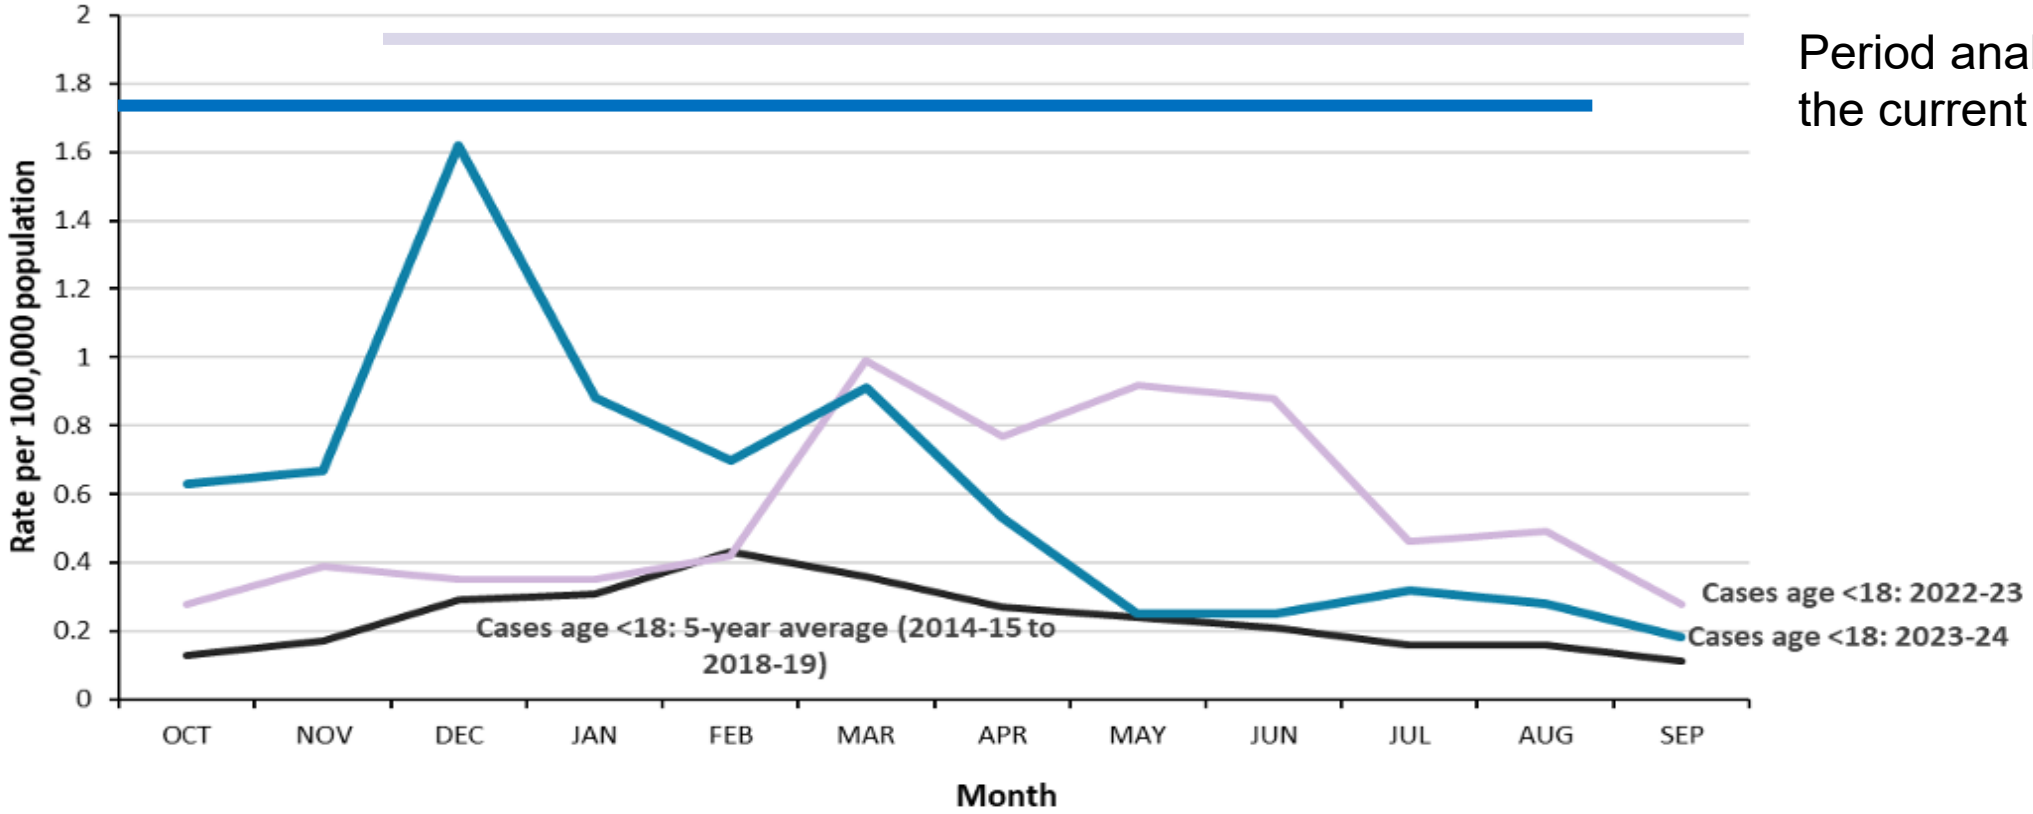
- Pharyngitis
- SSTI (e.g. impetigo)
- Scarlet fever

- Seasonality observed with non-invasive GAS disease





Rate of Invasive GAS reported in Ontario between 2022-2024 among children



Period analyzed within the current study

Clinical and bacterial characteristics of GAS

All clinical specimens with GAS isolated from SickKids between December 1, 2022 to August 31, 2024

- Time period chosen to correspond with increase iGAS prevalence

Only 1 specimen per patient per 2-week period included in analysis

Patient and bacterial evaluation

- Clinical characteristics
  - Including age, collection site, clinical presentation
- Bacterial isolate whole genome sequencing (performed with ONT)
  - *emm*-type

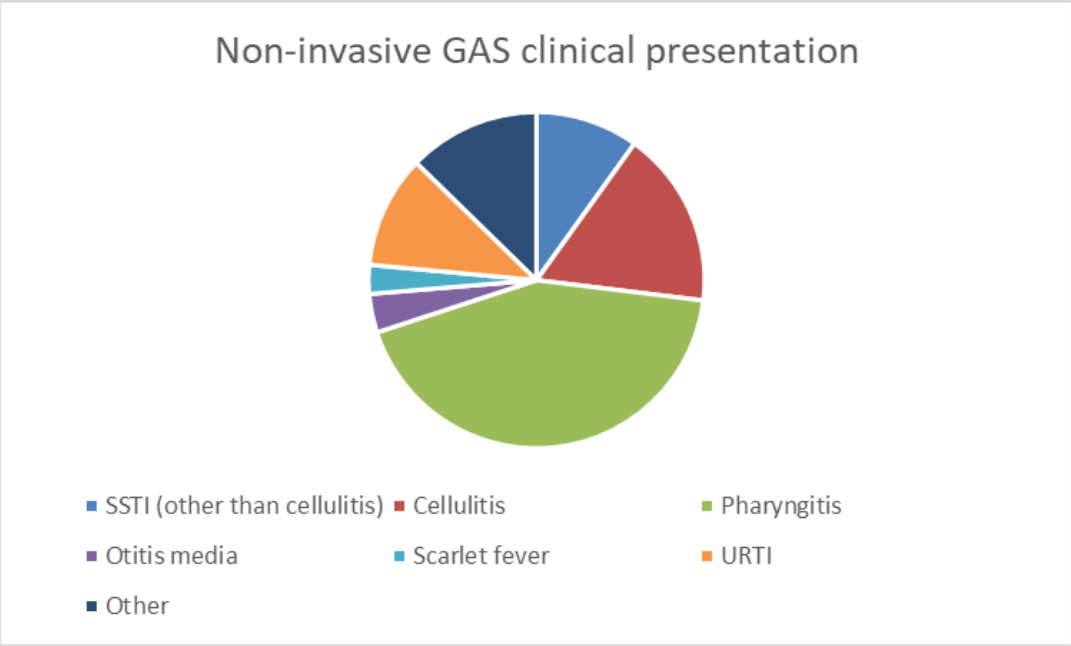
Age distribution of patients with invasive and non-invasive GAS

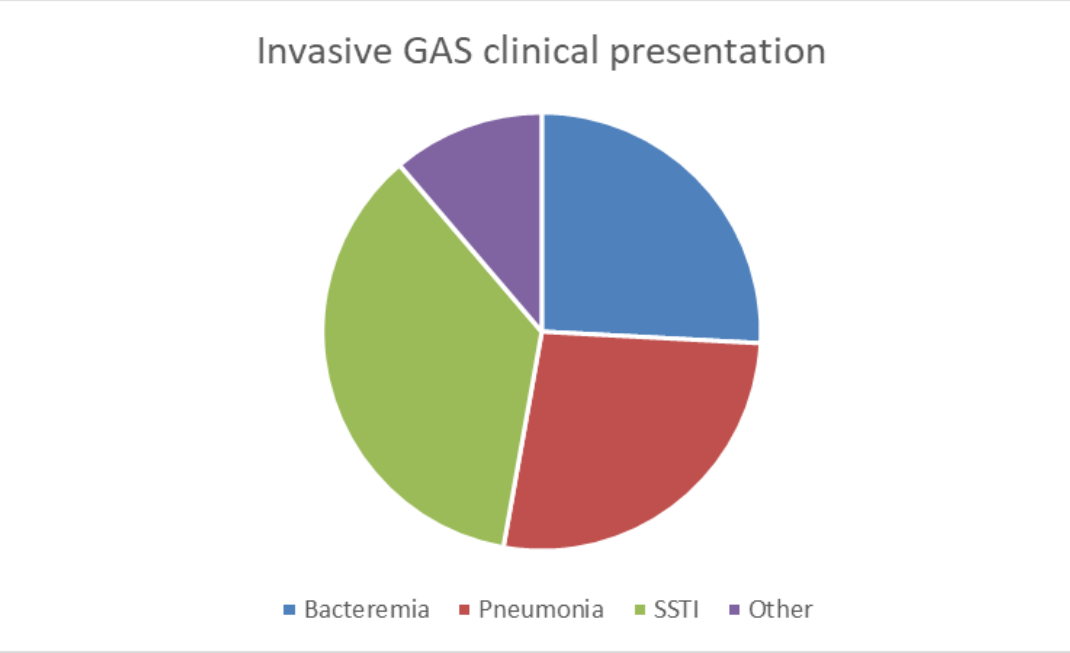
	Overall (n=408)	Non-invasive GAS (n=319)	Invasive GAS (n=89)
Age in years, median (IQR)	6 (4, 8.5)	6 (4, 9)	5 (2, 7)

Characteristics of patients with invasive and non-invasive GAS

	Overall (n=408)	Non-invasive GAS (n=319)	Invasive GAS (n=89)
Male sex, N (%)	226 (55%)	176 (55%)	50 (56%)
Underlying Medical Conditions, N (%)	147 (36%)	119 (37%)	28 (46%)
Eczema / Skin Condition	40 (10%)	36 (11%)	4 (4%)
Asthma / Resp	13 (3%)	12 (4%)	1 (1%)
Developmental	20 (5%)	12 (4%)	8 (9%)
Malignancy / Transplant	12 (3%)	10 (3%)	2 (2%)

Clinical presentation of GAS

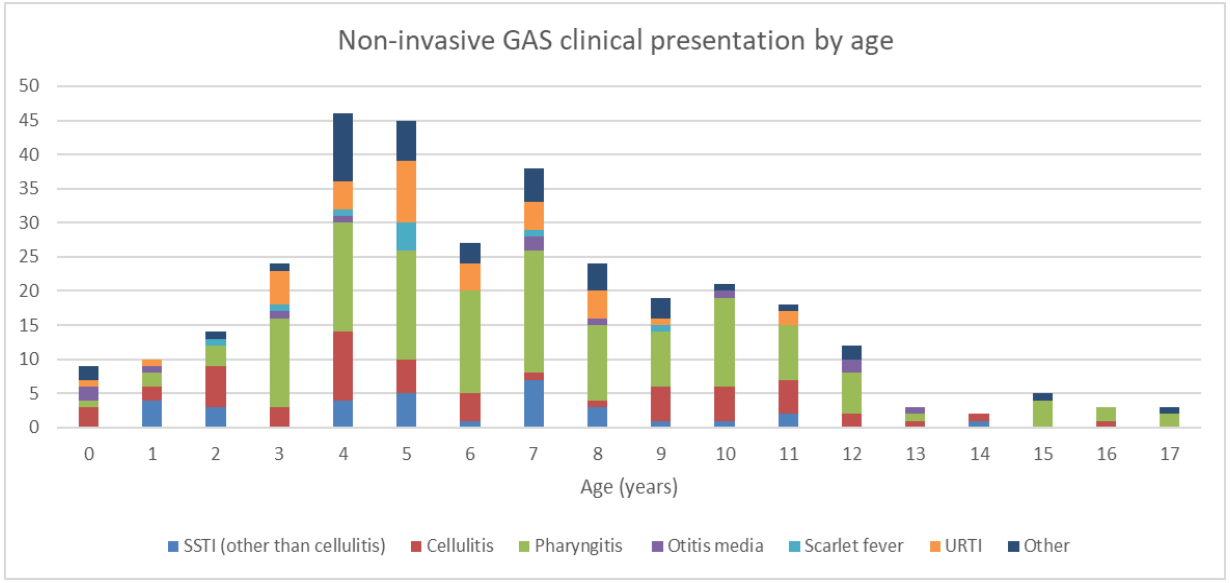


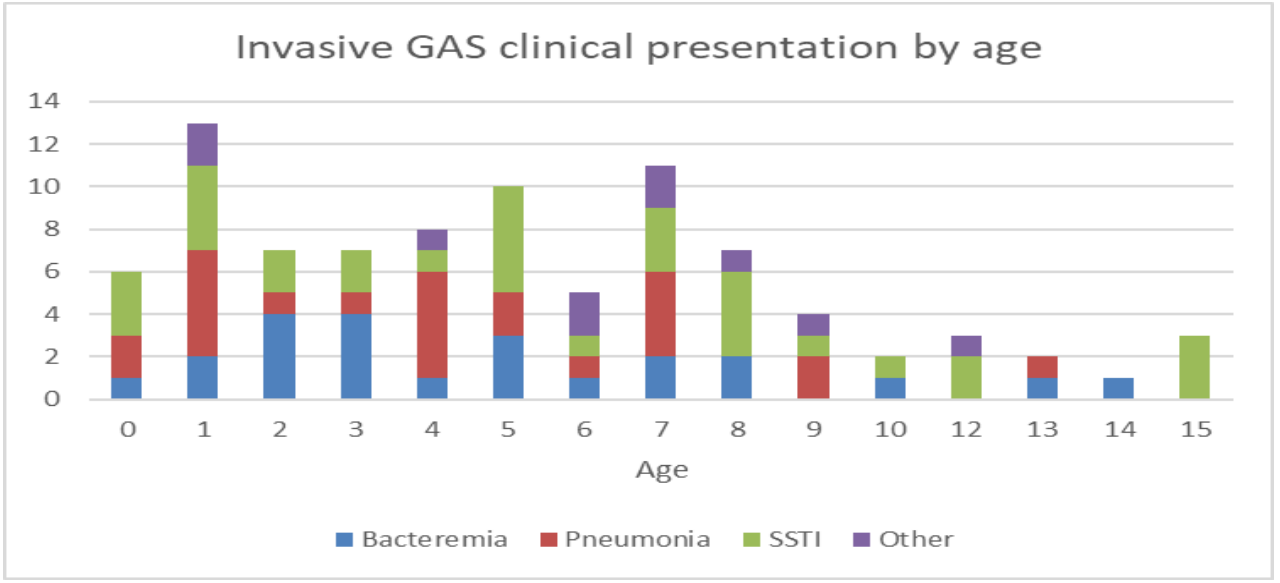


Total non-invasive isolates	88
WGS completed	81

Total invasive isolates	324
WGS completed	291

Clinical presentation of GAS (2)





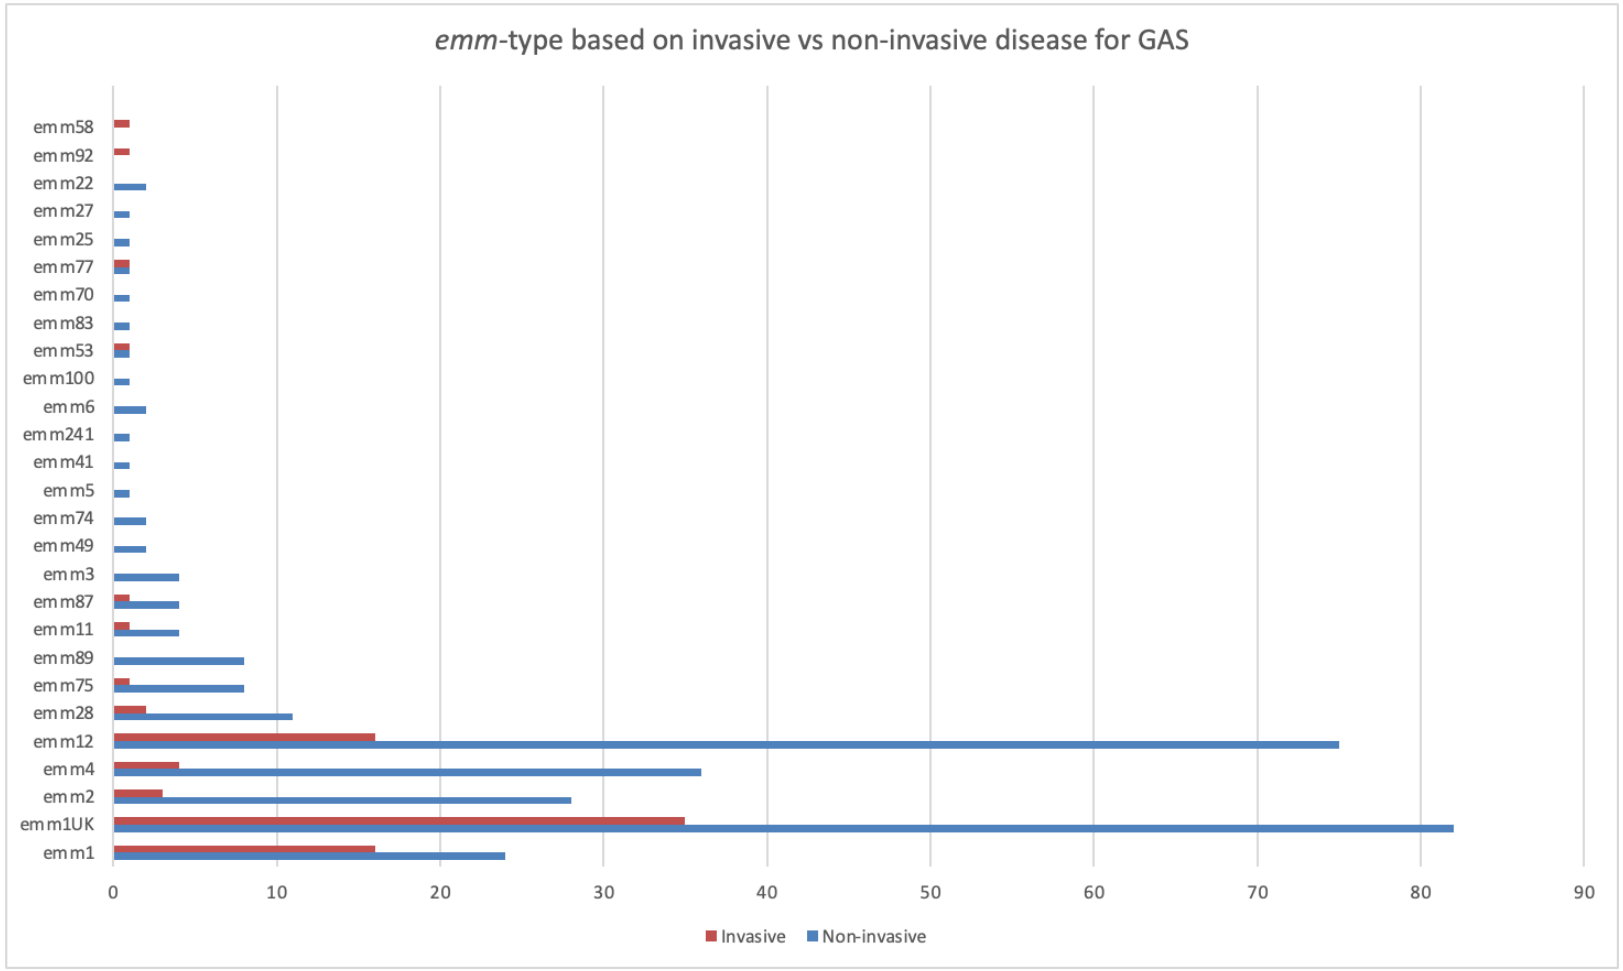
emm-type based on clinical presentation (invasive vs non-invasive)

Top 3 invasive *emm*-types:

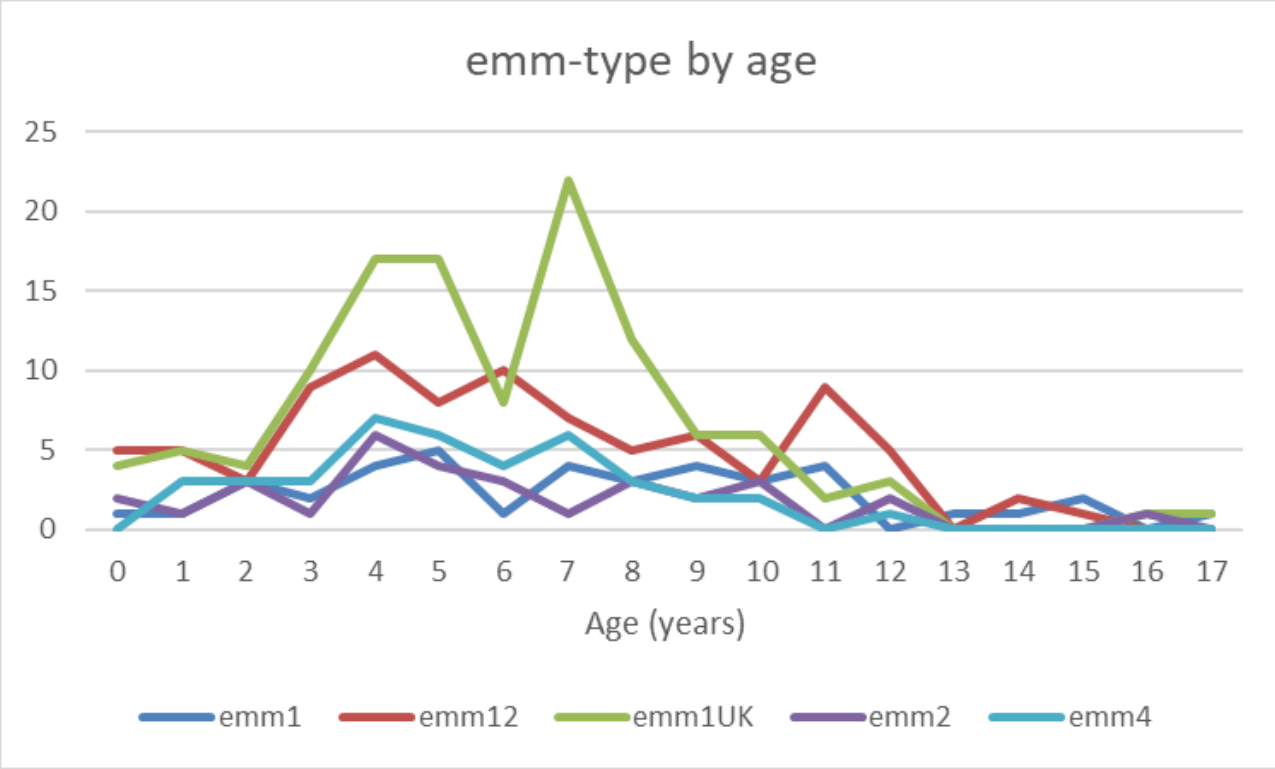
1. emm1UK
2. emm12
3. emm1

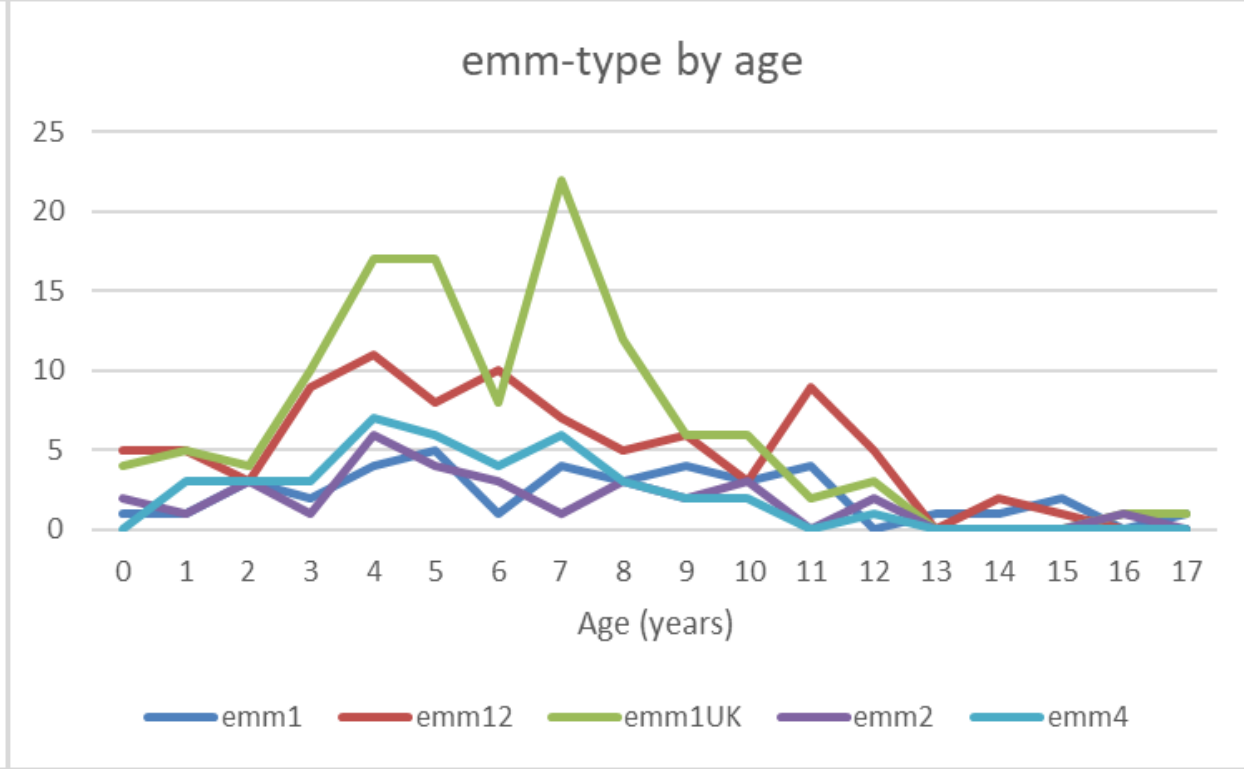
Top 3 non-invasive *emm*-types:

1. emm1UK
2. emm12
3. **emm2** (**emm4**, emm1)



Most common *emm*-type distribution by age

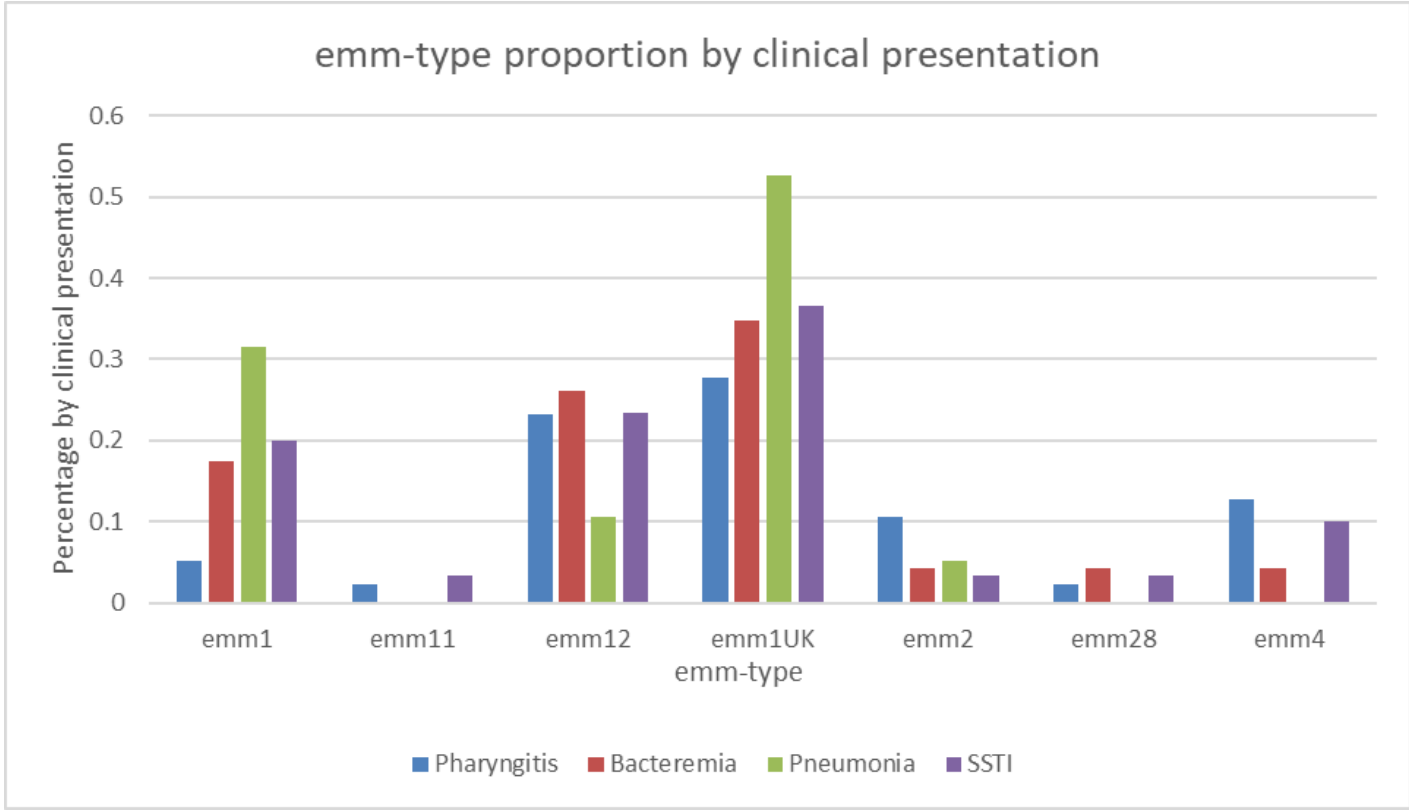




Proportion of *emm*-type by clinical presentation

Similar proportions observed with few exceptions:

- Decreased *emm*1 among pharyngitis
- Decreased *emm*12 among patients presenting with pneumonia
- Increased *emm*1UK among patients presenting with pneumoniae



Conclusion

*emm*1UK and *emm*12 were present in a similar proportion for invasive and non-invasive isolates

emm1UK predominate lineage in both clinical cohorts

*emm*1 was present in invasive isolates more than non-invasive isolates

e.g. Few emm1 isolates among children with pharyngitis

*emm*2 and *emm*4 was present in higher amounts among non-invasive isolates

e.g. Few *emm*2/*emm*4 invasive isolates were observed

TIBDN and iGAS Surveillance

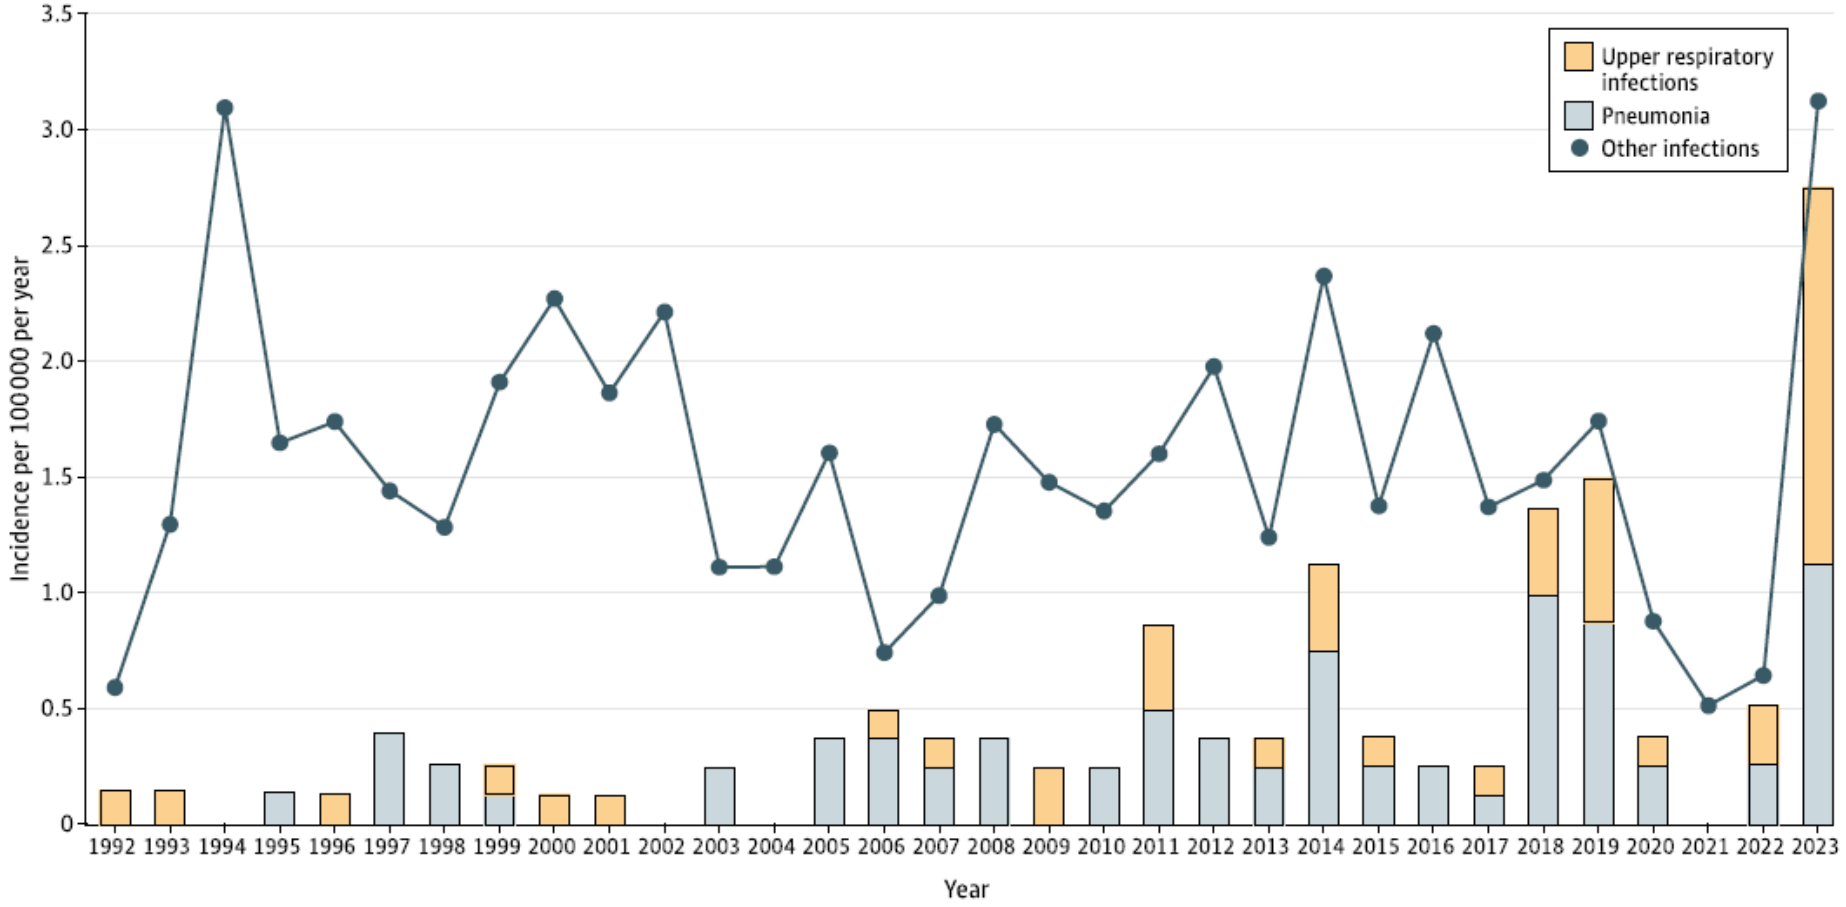
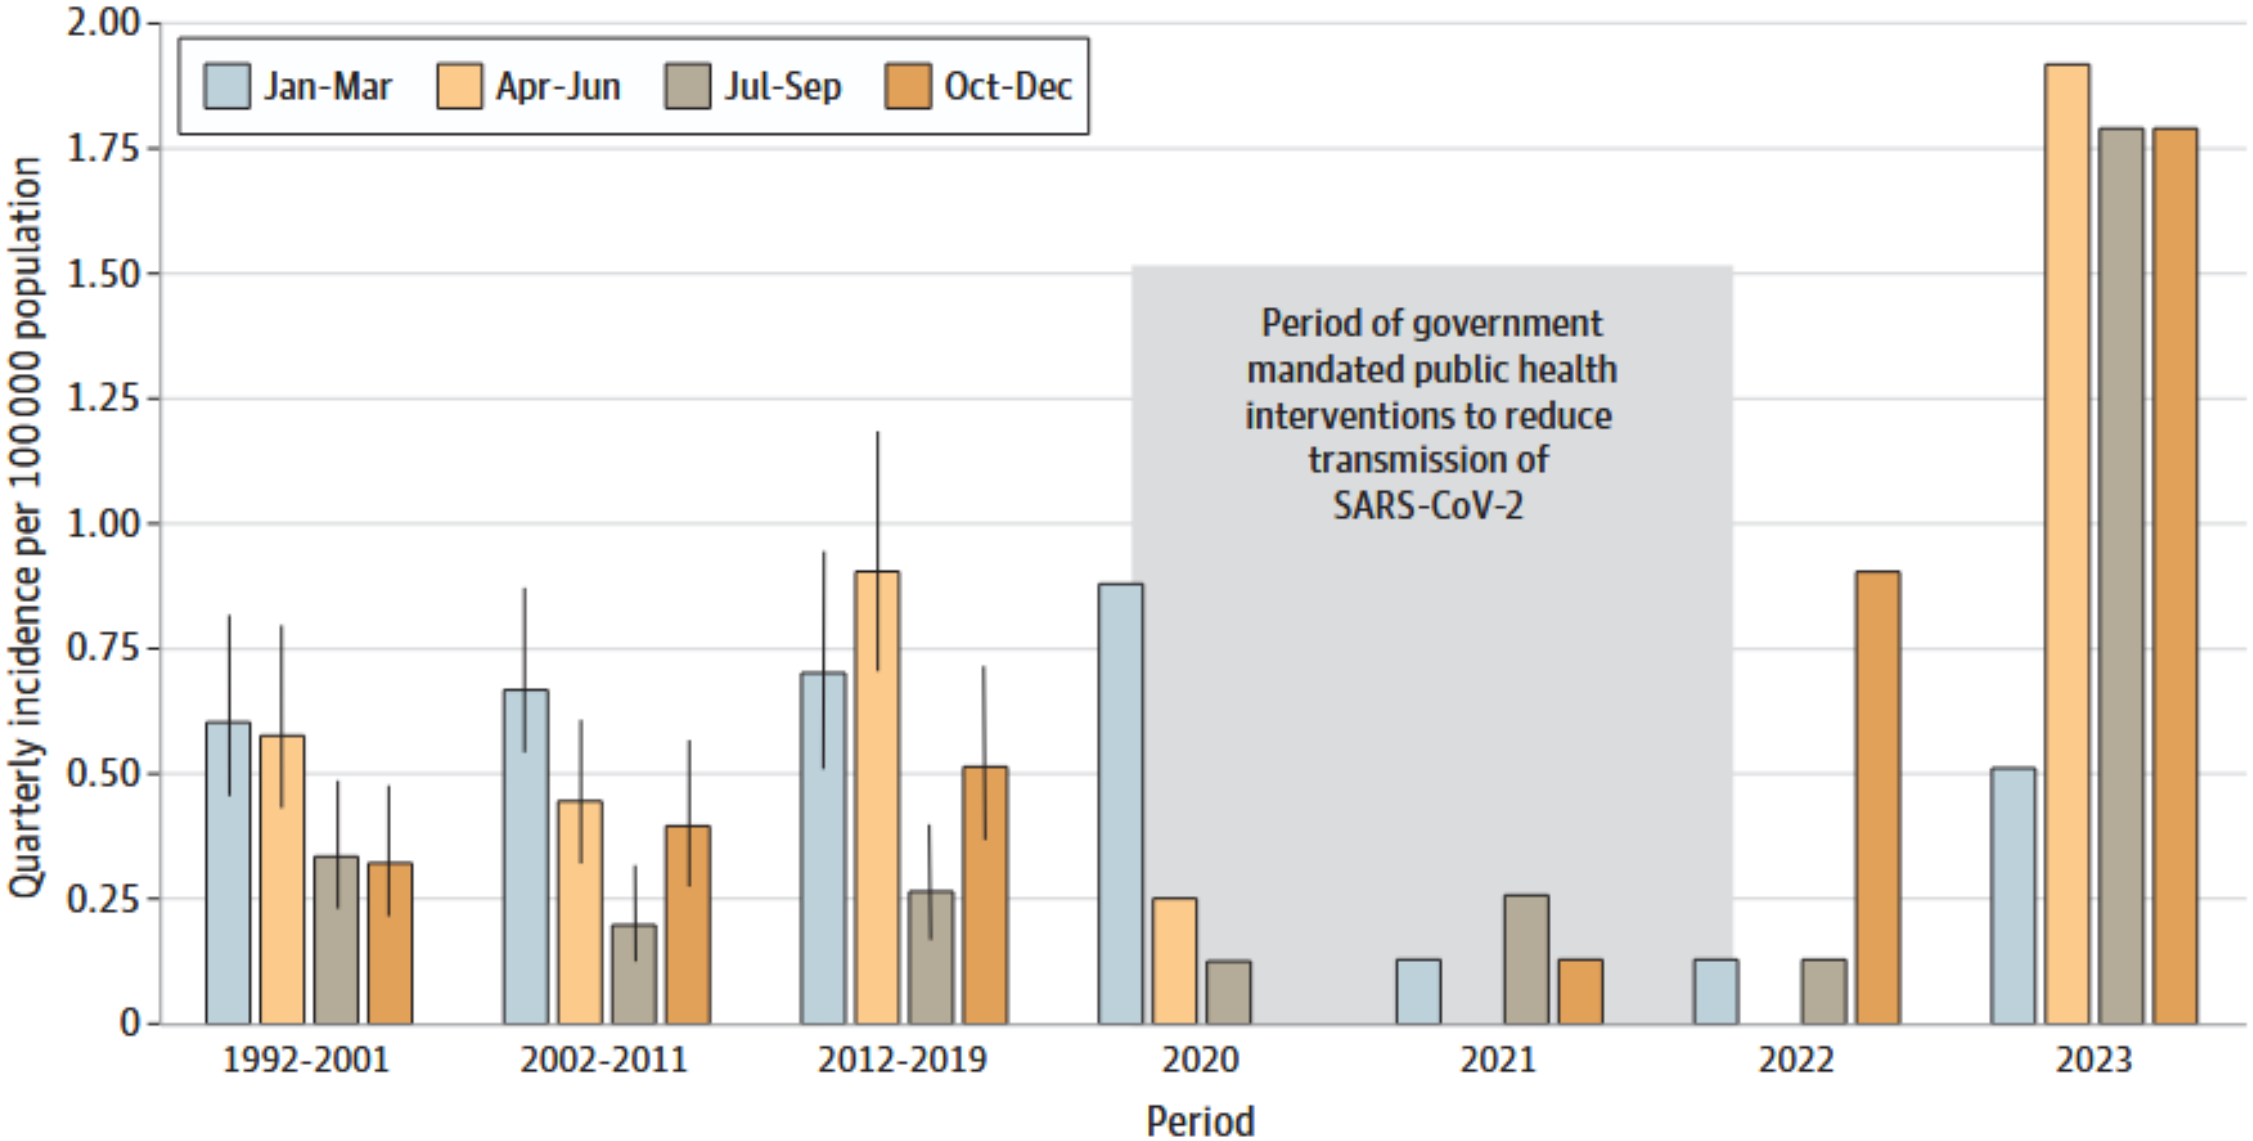
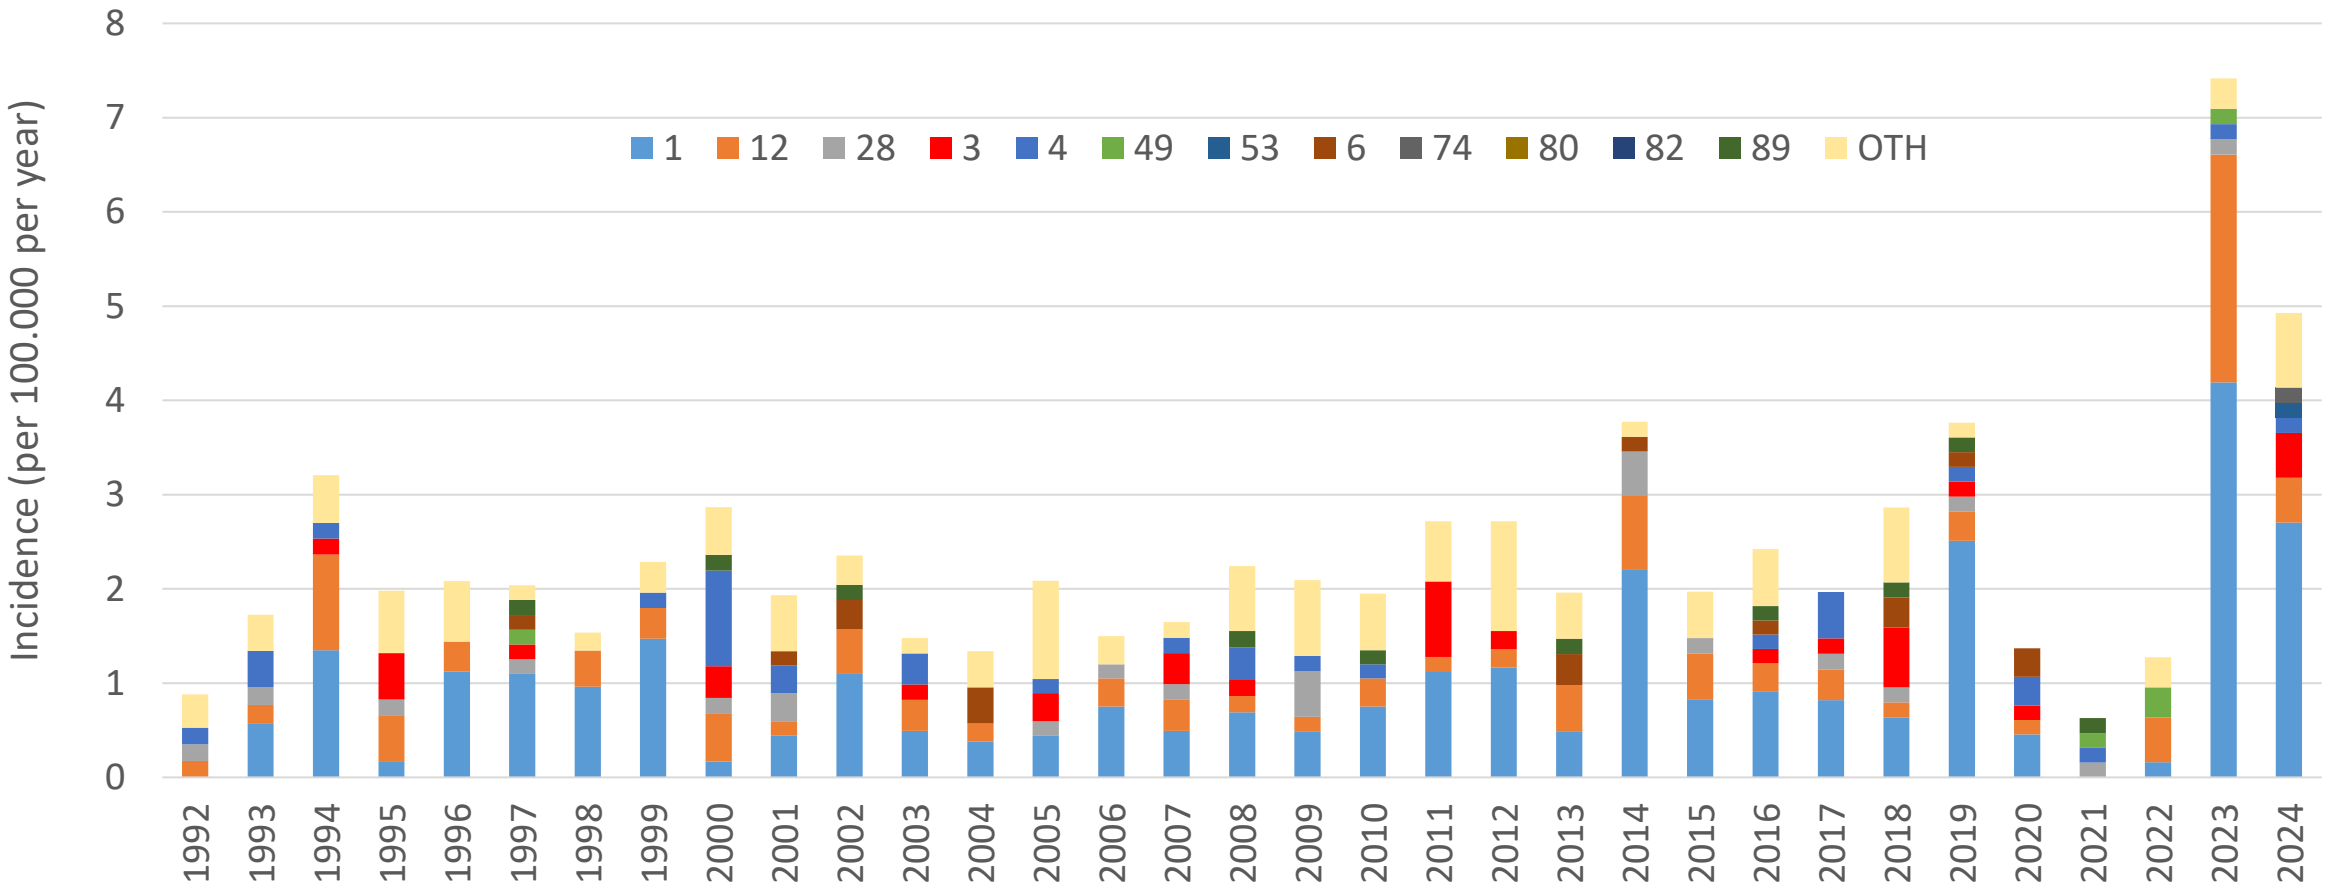
Incidence of pediatric invasive GAS disease, Toronto/Peel, 1992-2023



Seasonality of pediatric iGAS disease, Toronto/Peel, 1992-2023

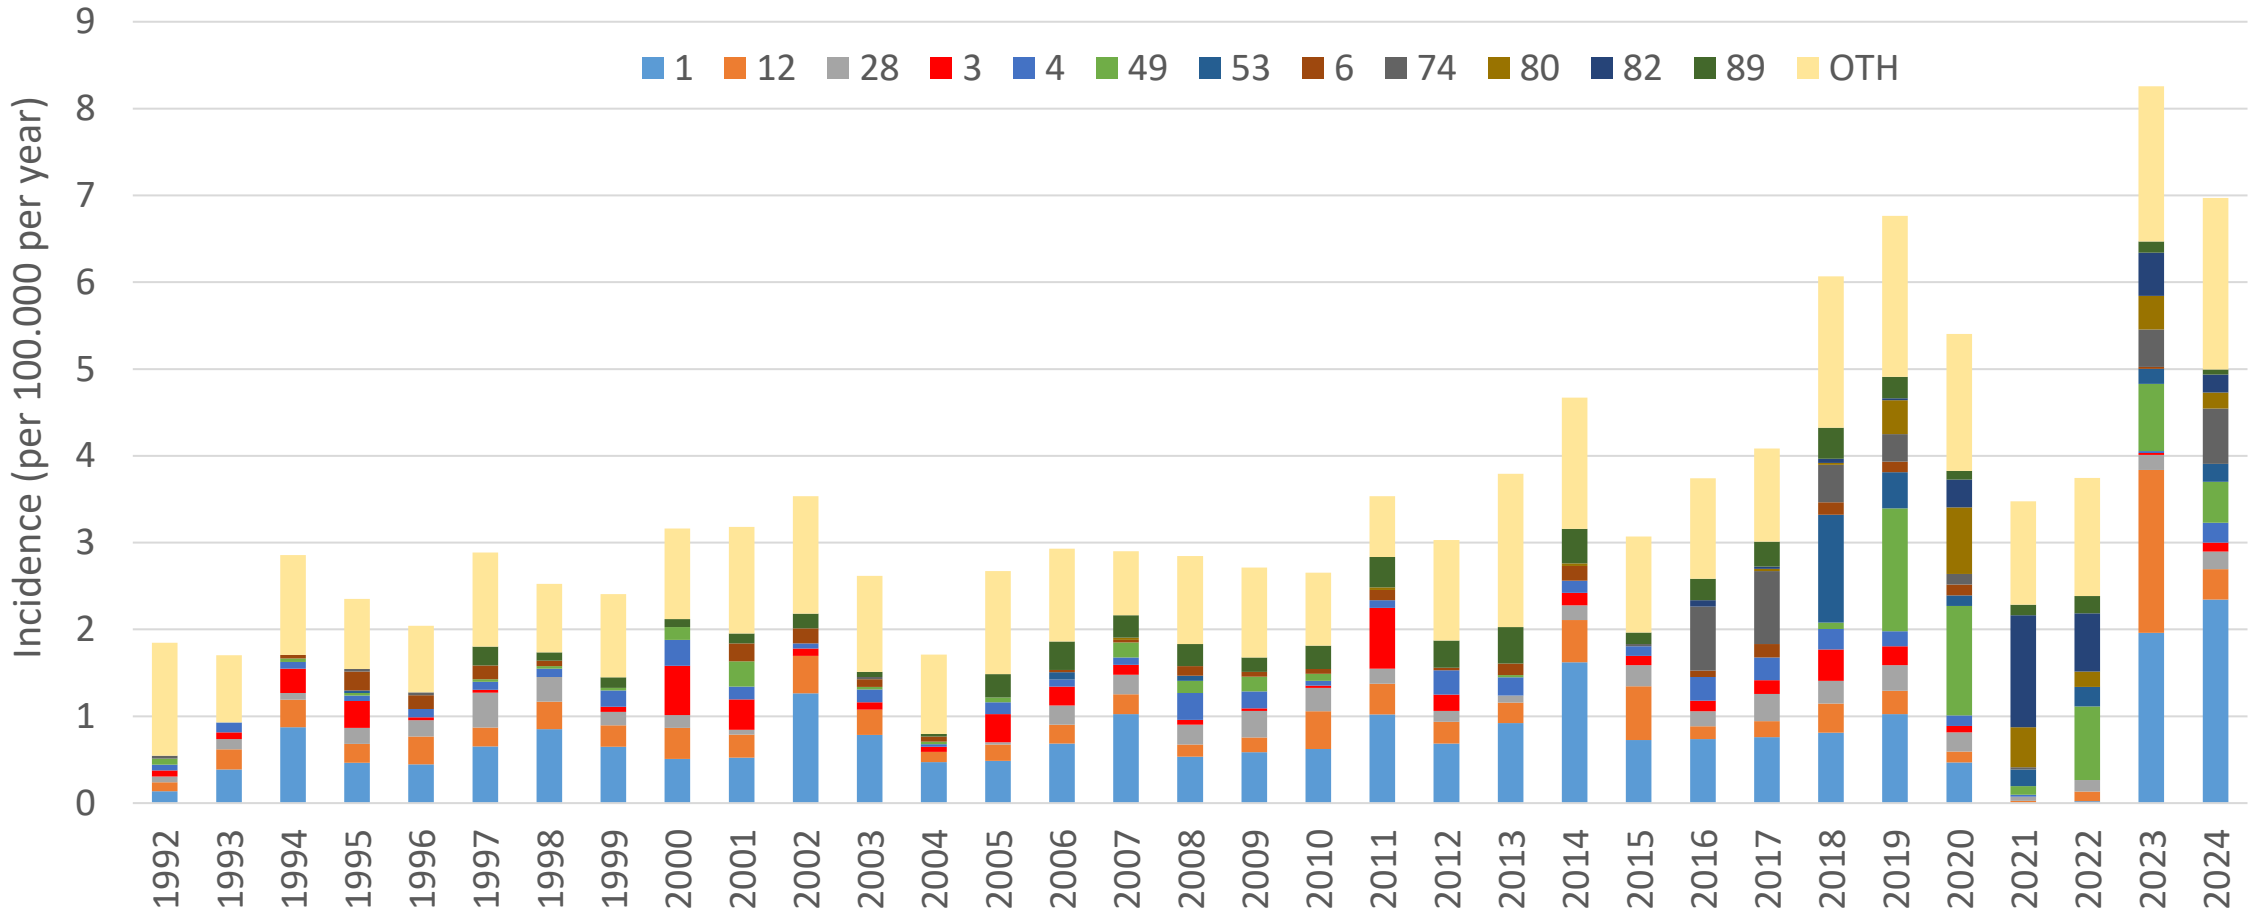


Incidence of iGAS, Toronto/Peel, Children (<15 years), 1992-2024

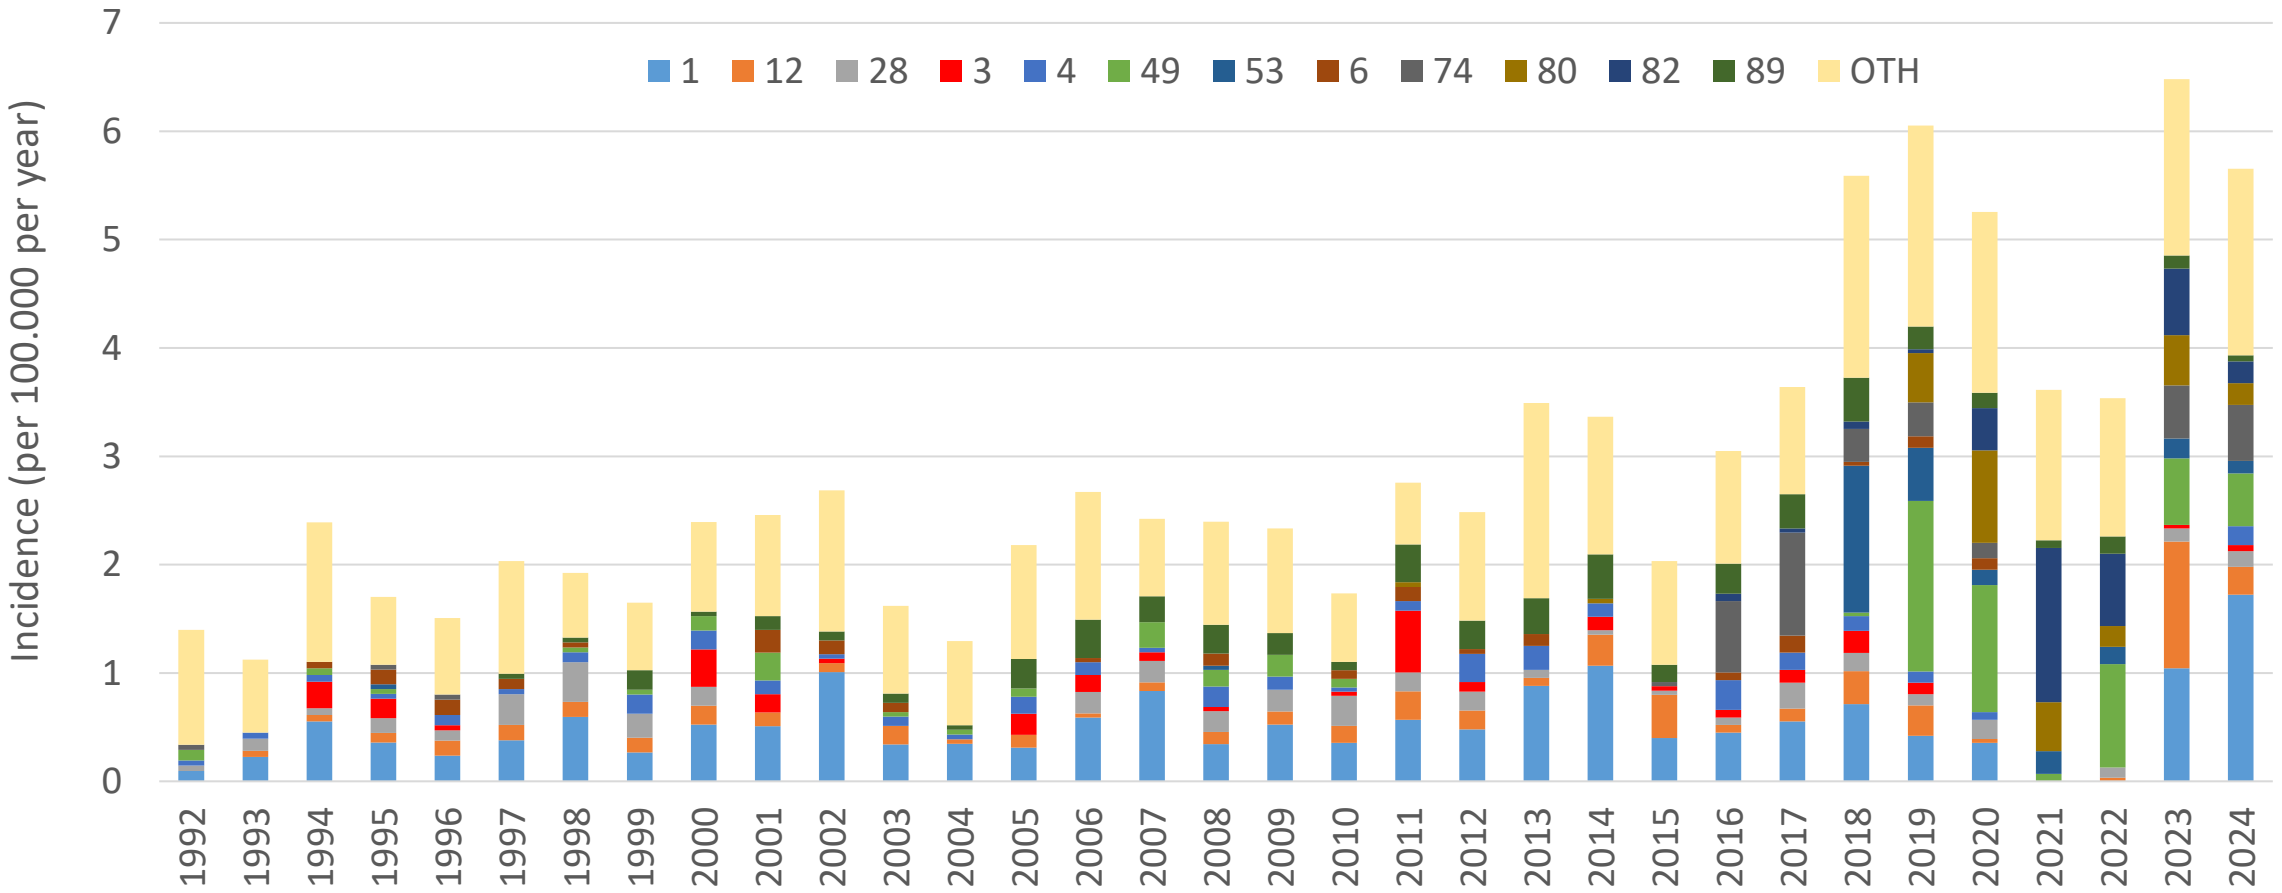


92.8% of emm types are included in the 30-valent GAS vaccine

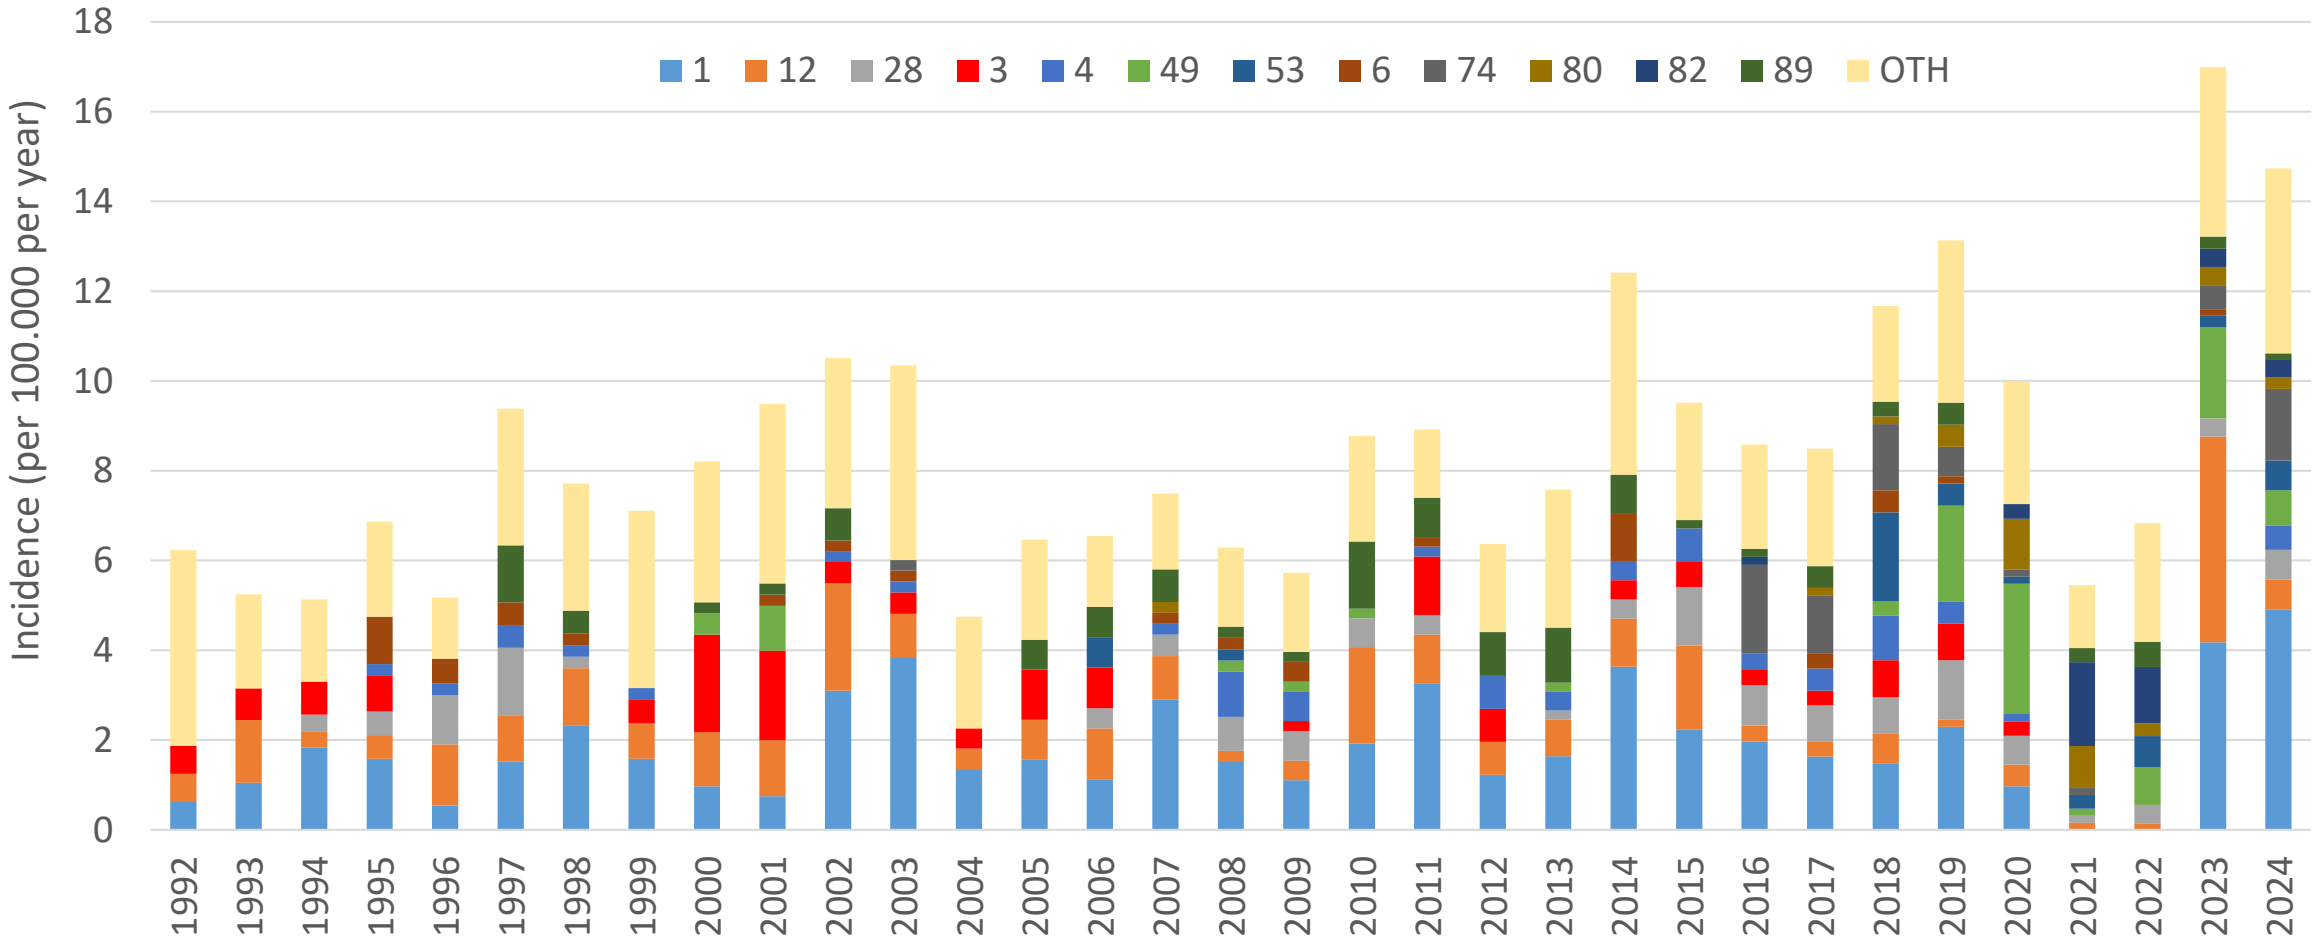
Incidence of iGAS, Toronto/Peel, All ages, 1992-2024



Incidence of iGAS, Toronto/Peel, Adults aged 15-64 years, 1992-2024



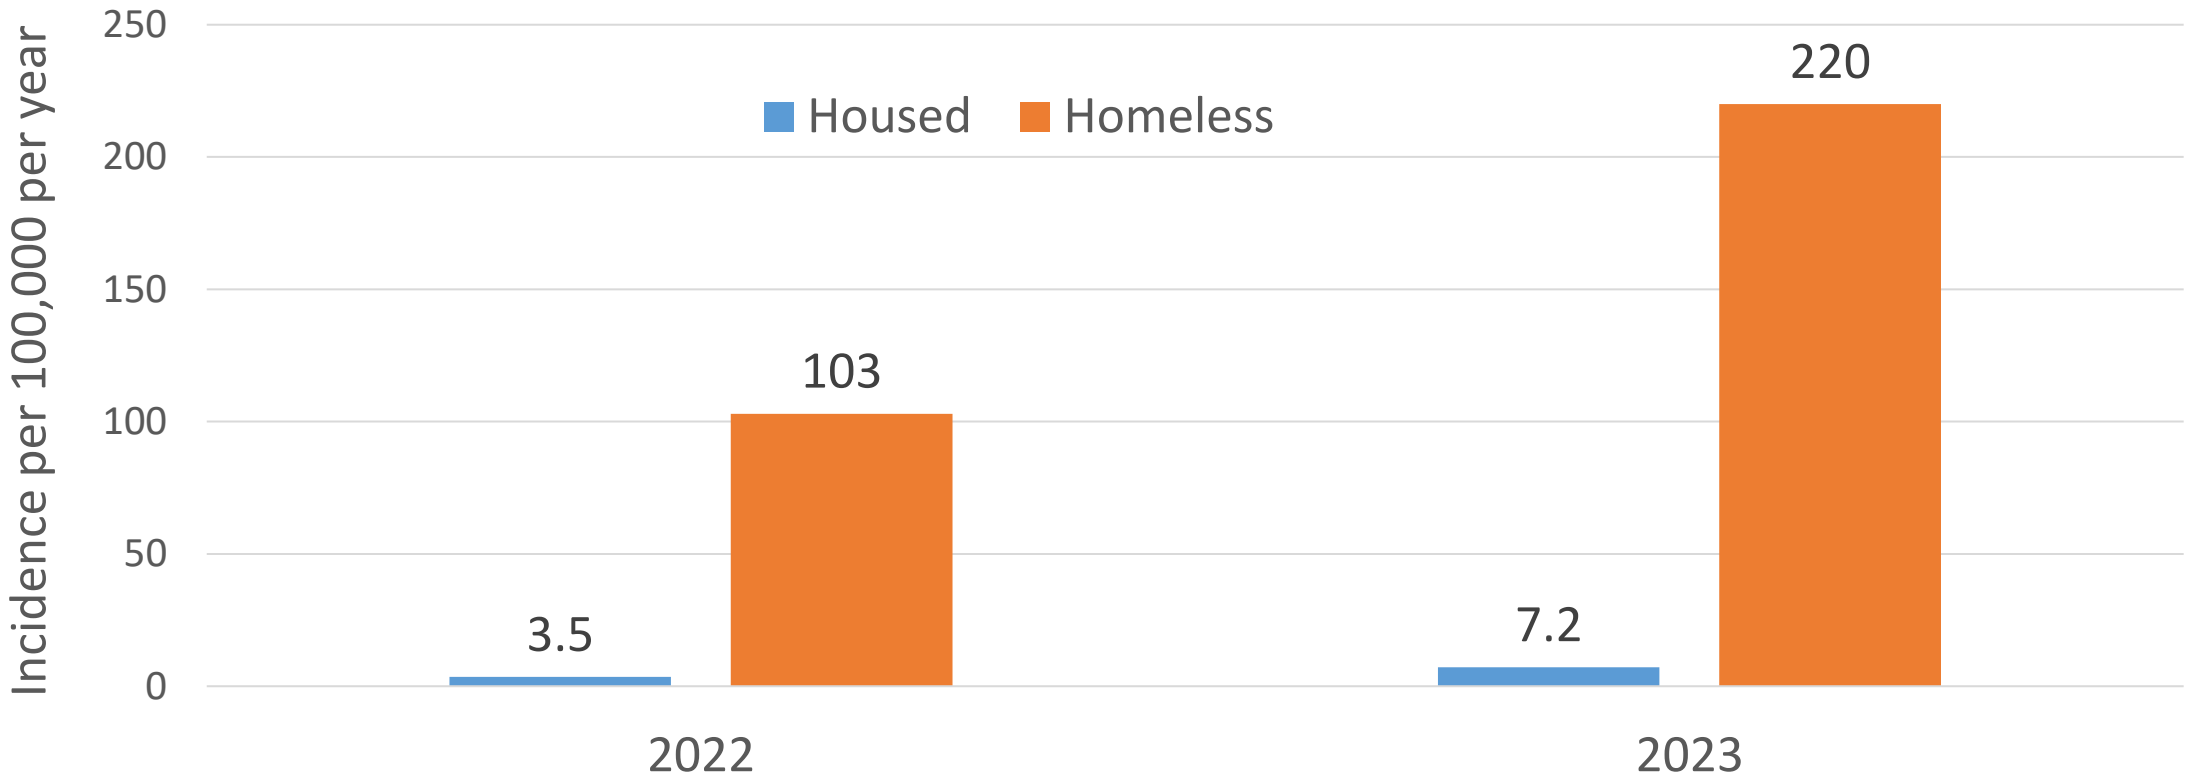
Incidence of iGAS, Toronto/Peel, Older adults (≥65 years), 1992-2024



What do you think will happen to iGAS in the next decade?

1. The current post-pandemic iGAS increase will settle, and the incidence will return to pre-pandemic levels
2. iGAS incidence will stabilize at or near 2024 levels
3. iGAS incidence will continue to increase
4. We will have a vaccine in less than 10 years, and iGAS will decline when a vaccine program is introduced.

Incidence of iGAS, housed and houseless adults, Toronto/Peel, 2022-2023



Characteristics of iGAS, housed and houseless adults, Toronto/Peel, 2022-2023

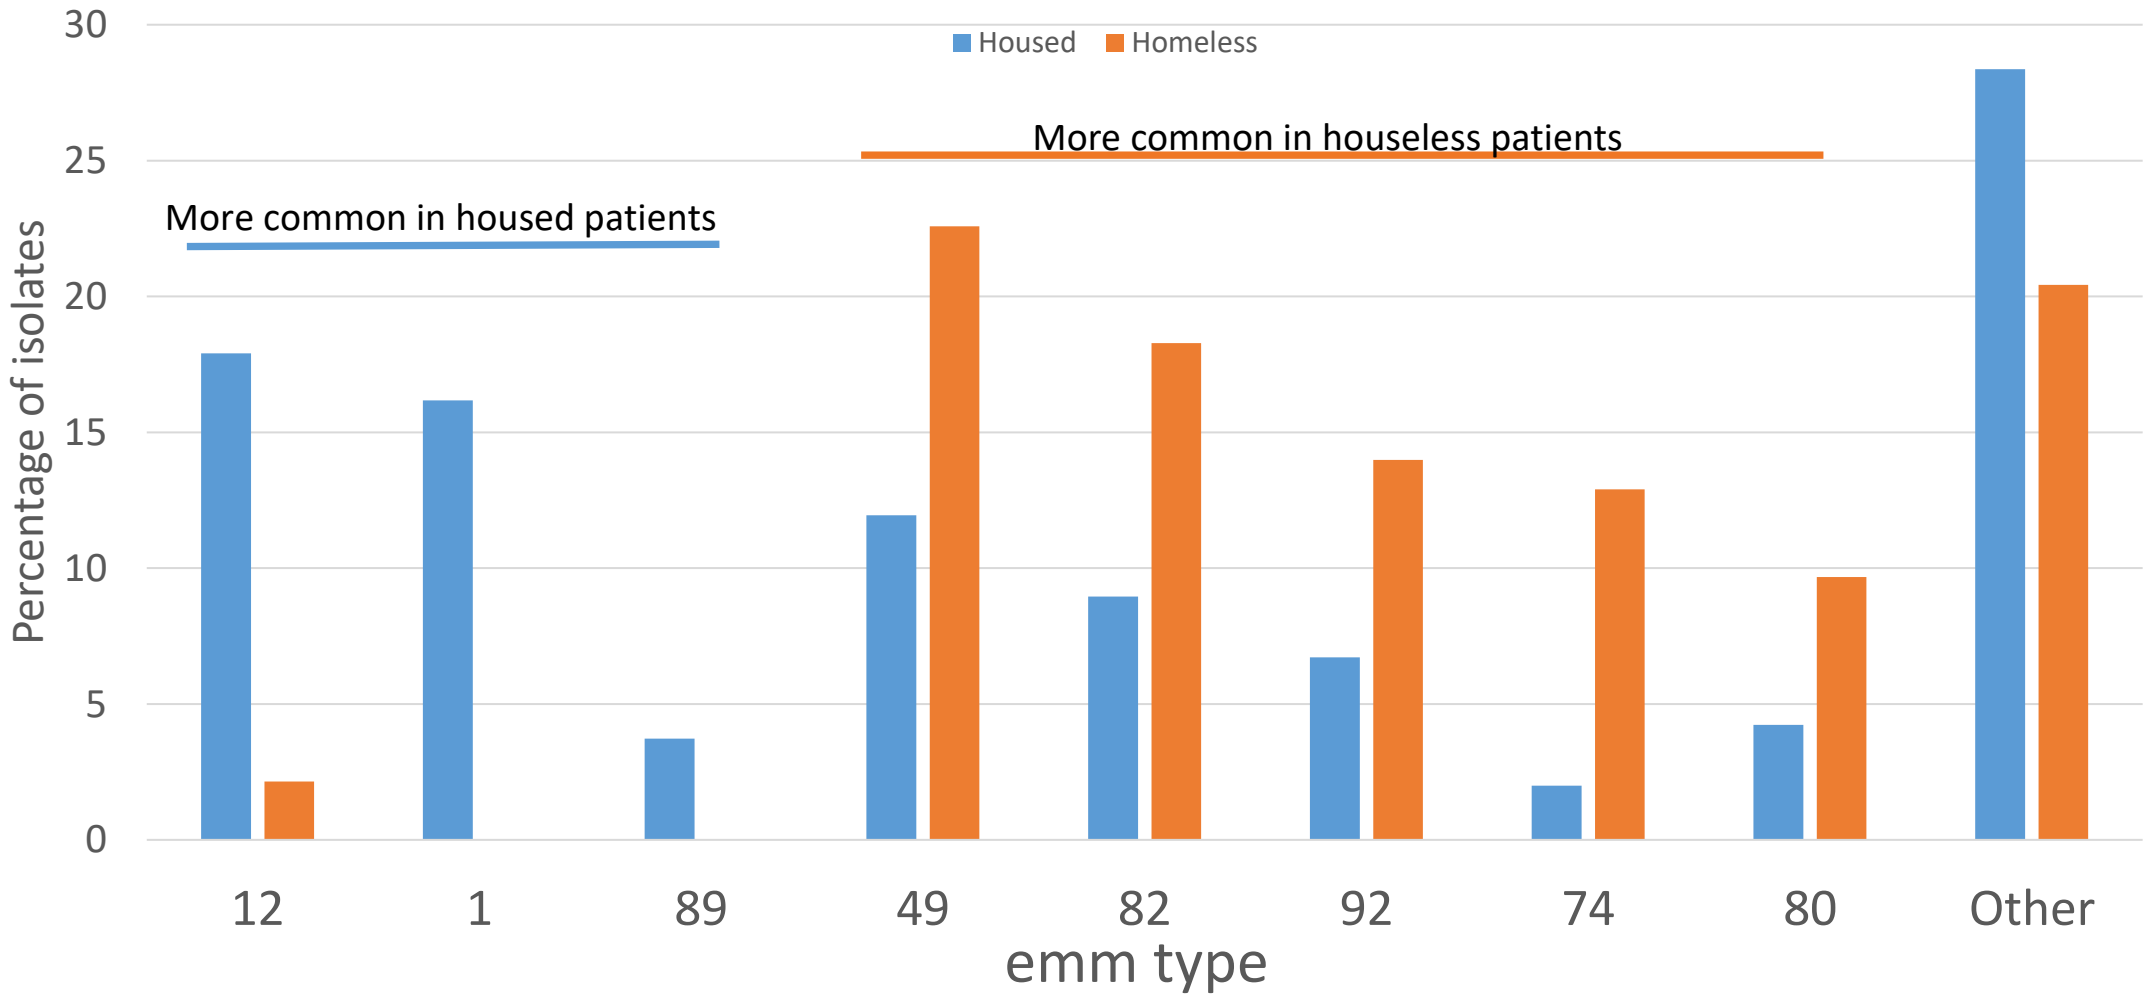
Emm type distribution in iGAS
Housed vs. houseless patients, Toronto/Peel, 2022-2023



In Sum

- Most of the pandemic associated decrease in iGAS was associated with reduced transmission of *emm*1, which is more common in children than in adults
- The incidence of iGAS appears to be increasing
- Homeless adults are more than 30x more likely to develop iGAS compared to housed adults
- The most advanced GAS vaccine in development covers >90% of strains causing iGAS in children, and about 75% of all strains
