# From Projections to Prevention: What Ontario's Illness Projections mean for Public Health

**PHO Rounds 2025-12-09**

Laura C. Rosella, PhD

Professor and Epidemiology Division Head

Dalla Lana School of Public Health, University of Toronto

Tier 1 Canada Research Chair in Population Health Transformation and Analytics

# Disclaimer

- This presentation was created by its author (Dr. Laura Rosella)
- PHO is not the owner of this content. Any application or use of the information in this document is the responsibility of the user.
- PHO assumes no liability resulting from any such application or use.

# Disclosures

- I do not have any disclosures to report

# Learning Objectives

1

Describe key findings from the Projected Patterns of Illness in Ontario report, including projected trends in major illness and multimorbidity through 2040.

2

Explain demographic, behavioural, and system drivers underlying Ontario's future health burden.

3

Interpret the implications of these projections for public health policy, prevention, and health system planning.

4

Apply insights from the report to identify actionable opportunities for public health standards, public health intervention, particularly in prevention & equity-oriented planning.

# Main Messages

---

Ontario's burden of illness is rising to unprecedented levels

---

Public health has distinct levers to influence that trajectory

---

Projections provide focus, alignment, and accountability for action

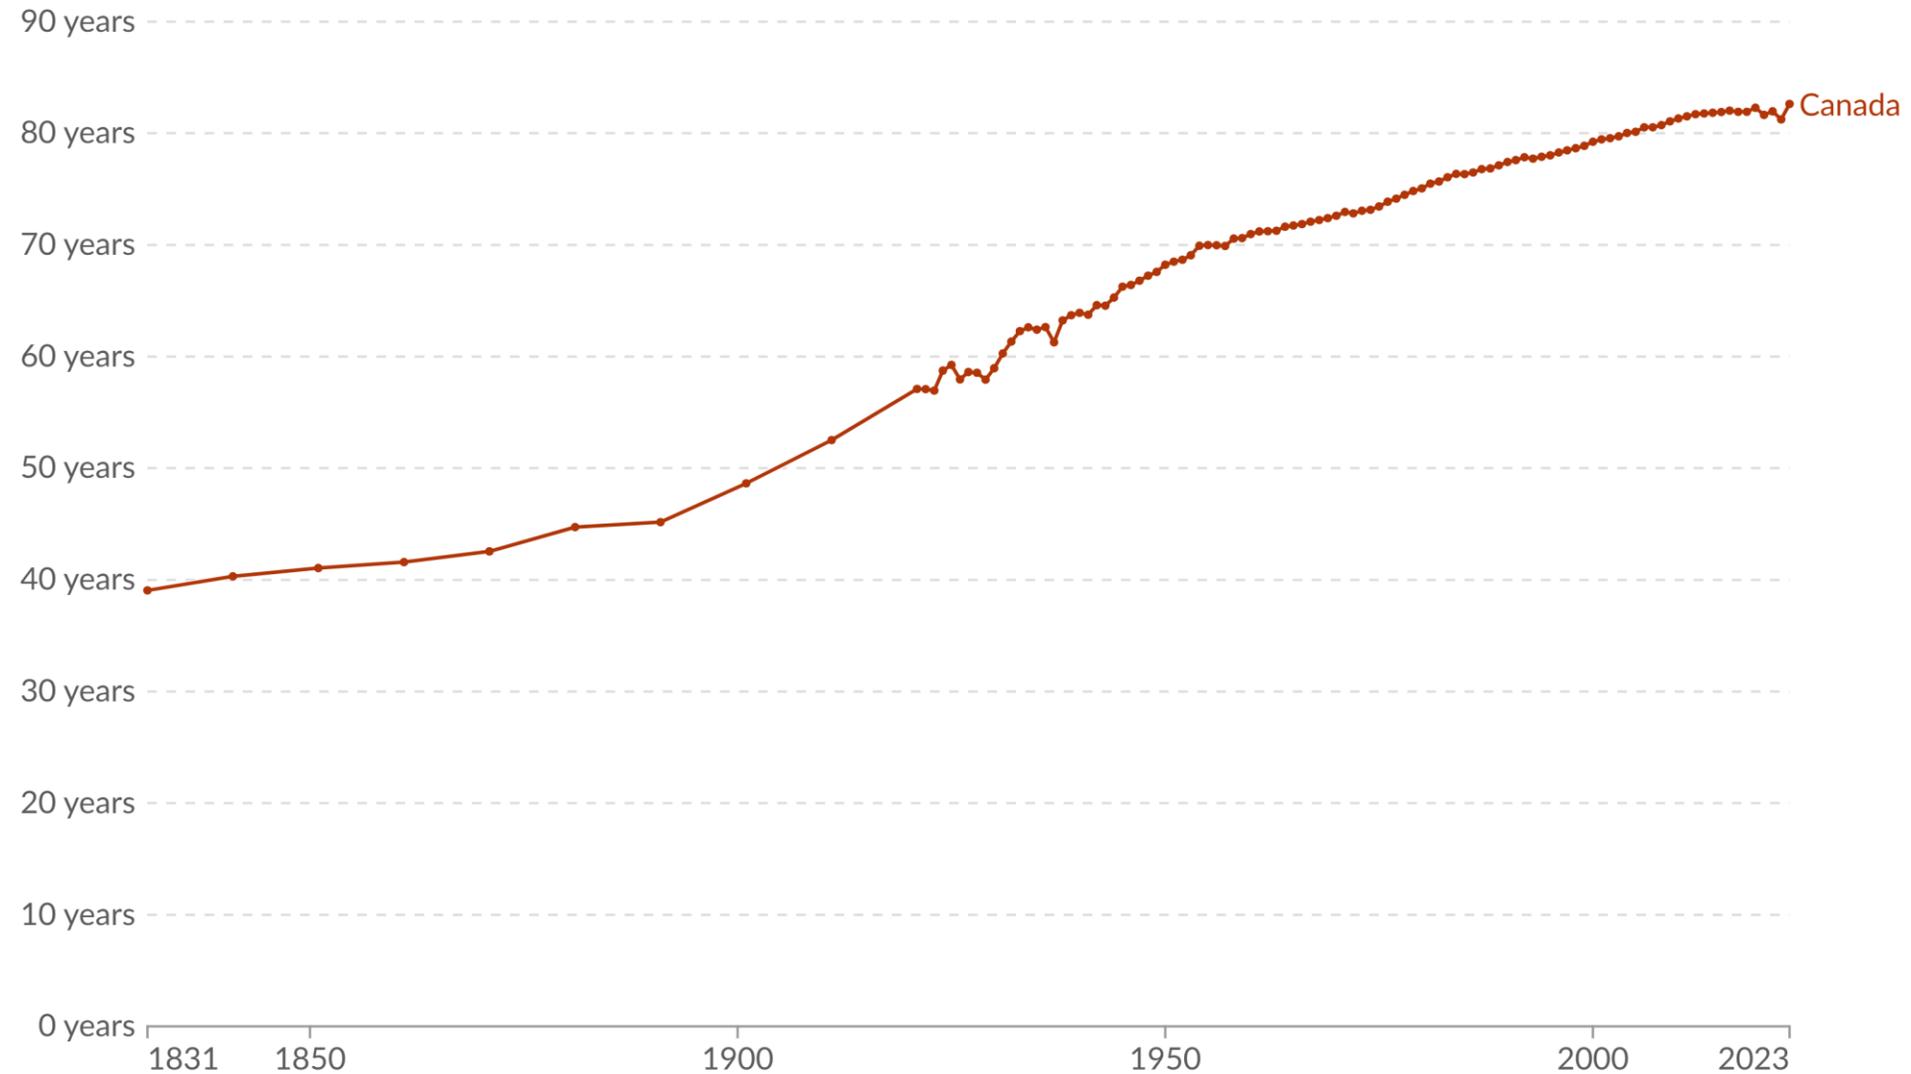

---

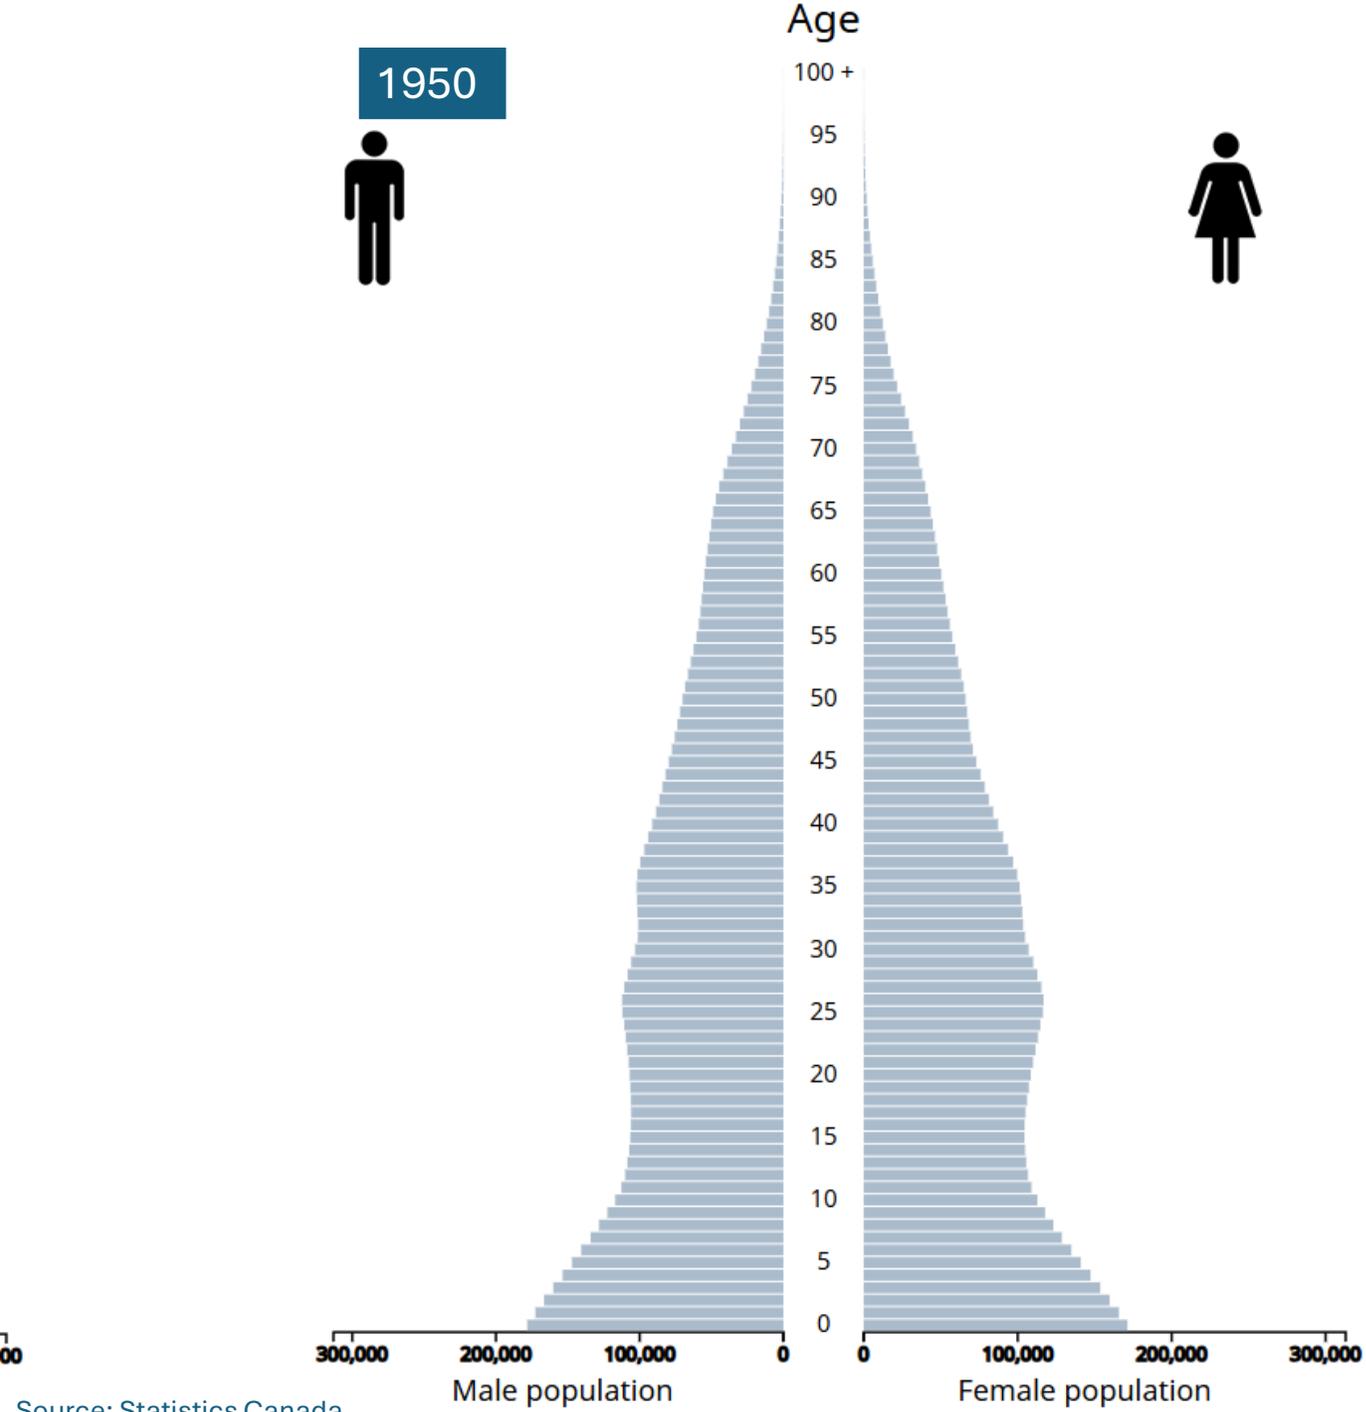

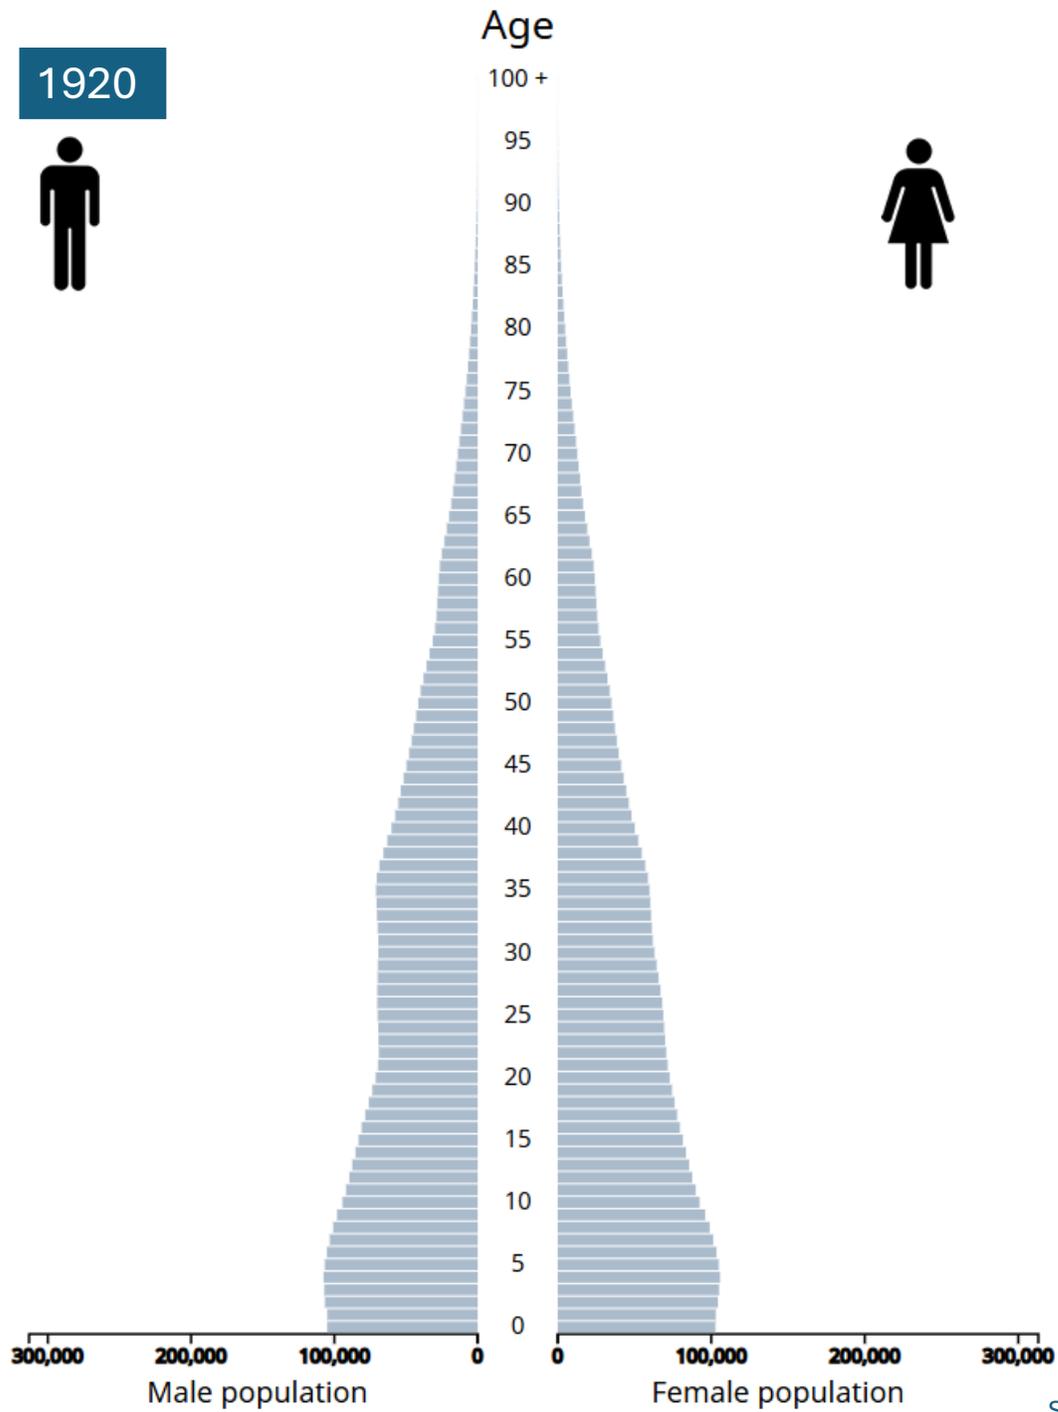

Data + modelling + indicators + evidence enable targeted local action

---

# Life expectancy

Period life expectancy<sup>1</sup> is the number of years the average person born in a certain year would live if they experienced the same chances of dying at each age as people did that year.

# Living longer with more illness

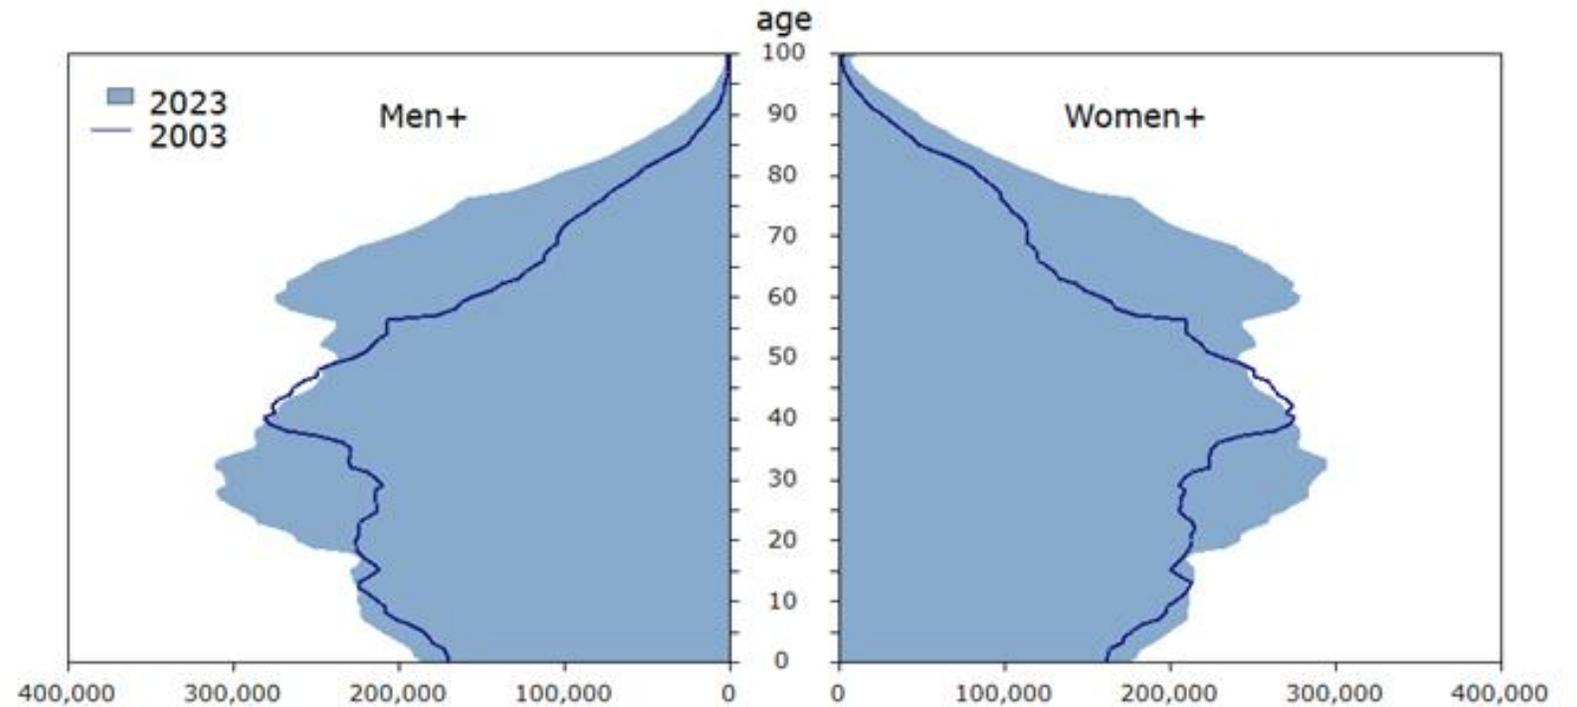

# Socioeconomic Gradients in Chronic Conditions at Time of Death

AGE ADJUSTED ABSOLUTE PERCENTAGE DIFFERENCE  
 In Chronic Condition At Time of Death (1994-2013)  
 Between Area Income Quintile 1 (lowest) and 5 (highest)

Rosella et al. Accumulation of chronic conditions at the time of death increased in Ontario from 1994 to 2013; Health Affairs, 2018.

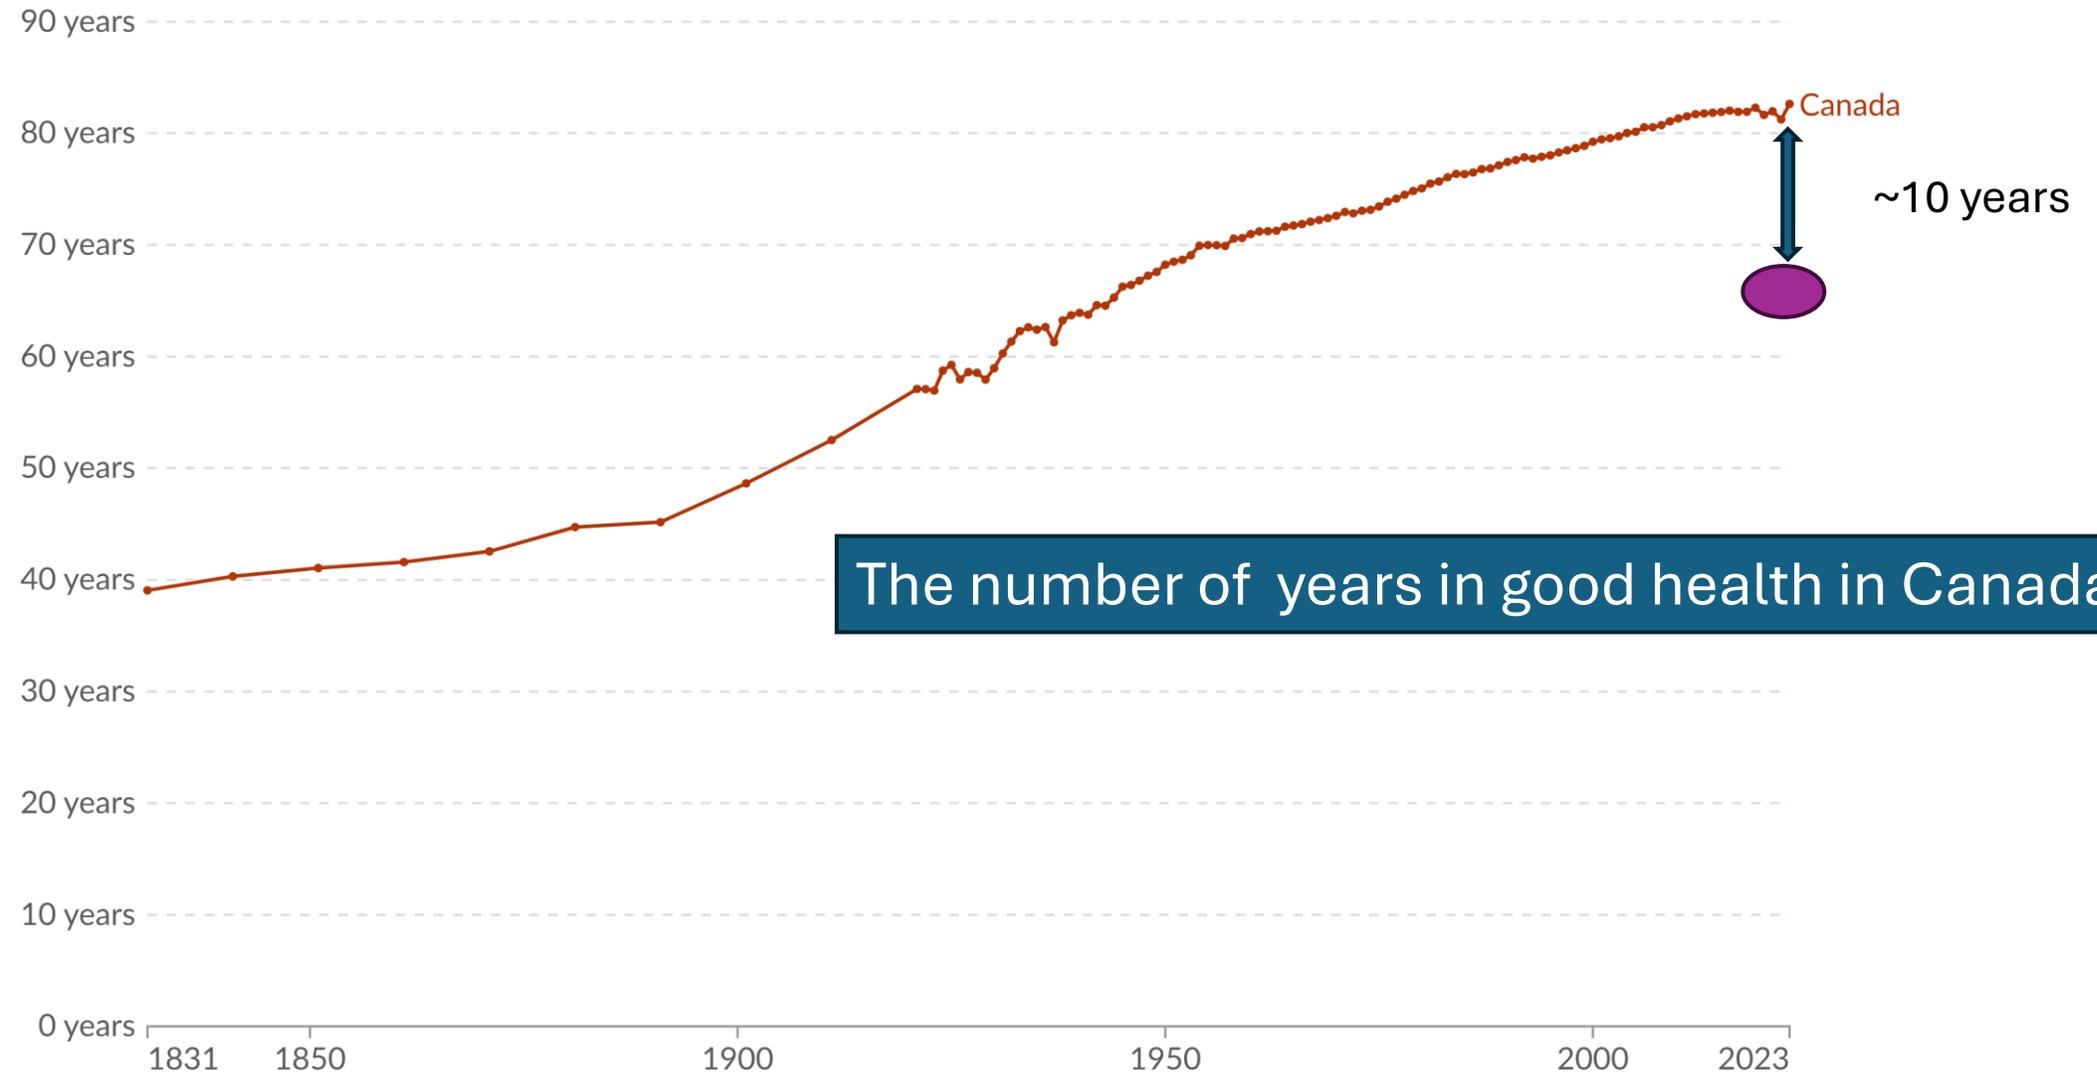

# From Baby Boom to Gray Wave

Source: Statistics Canada. (2024, February 21). Millennials now outnumber baby boomers in Canada. The Daily.

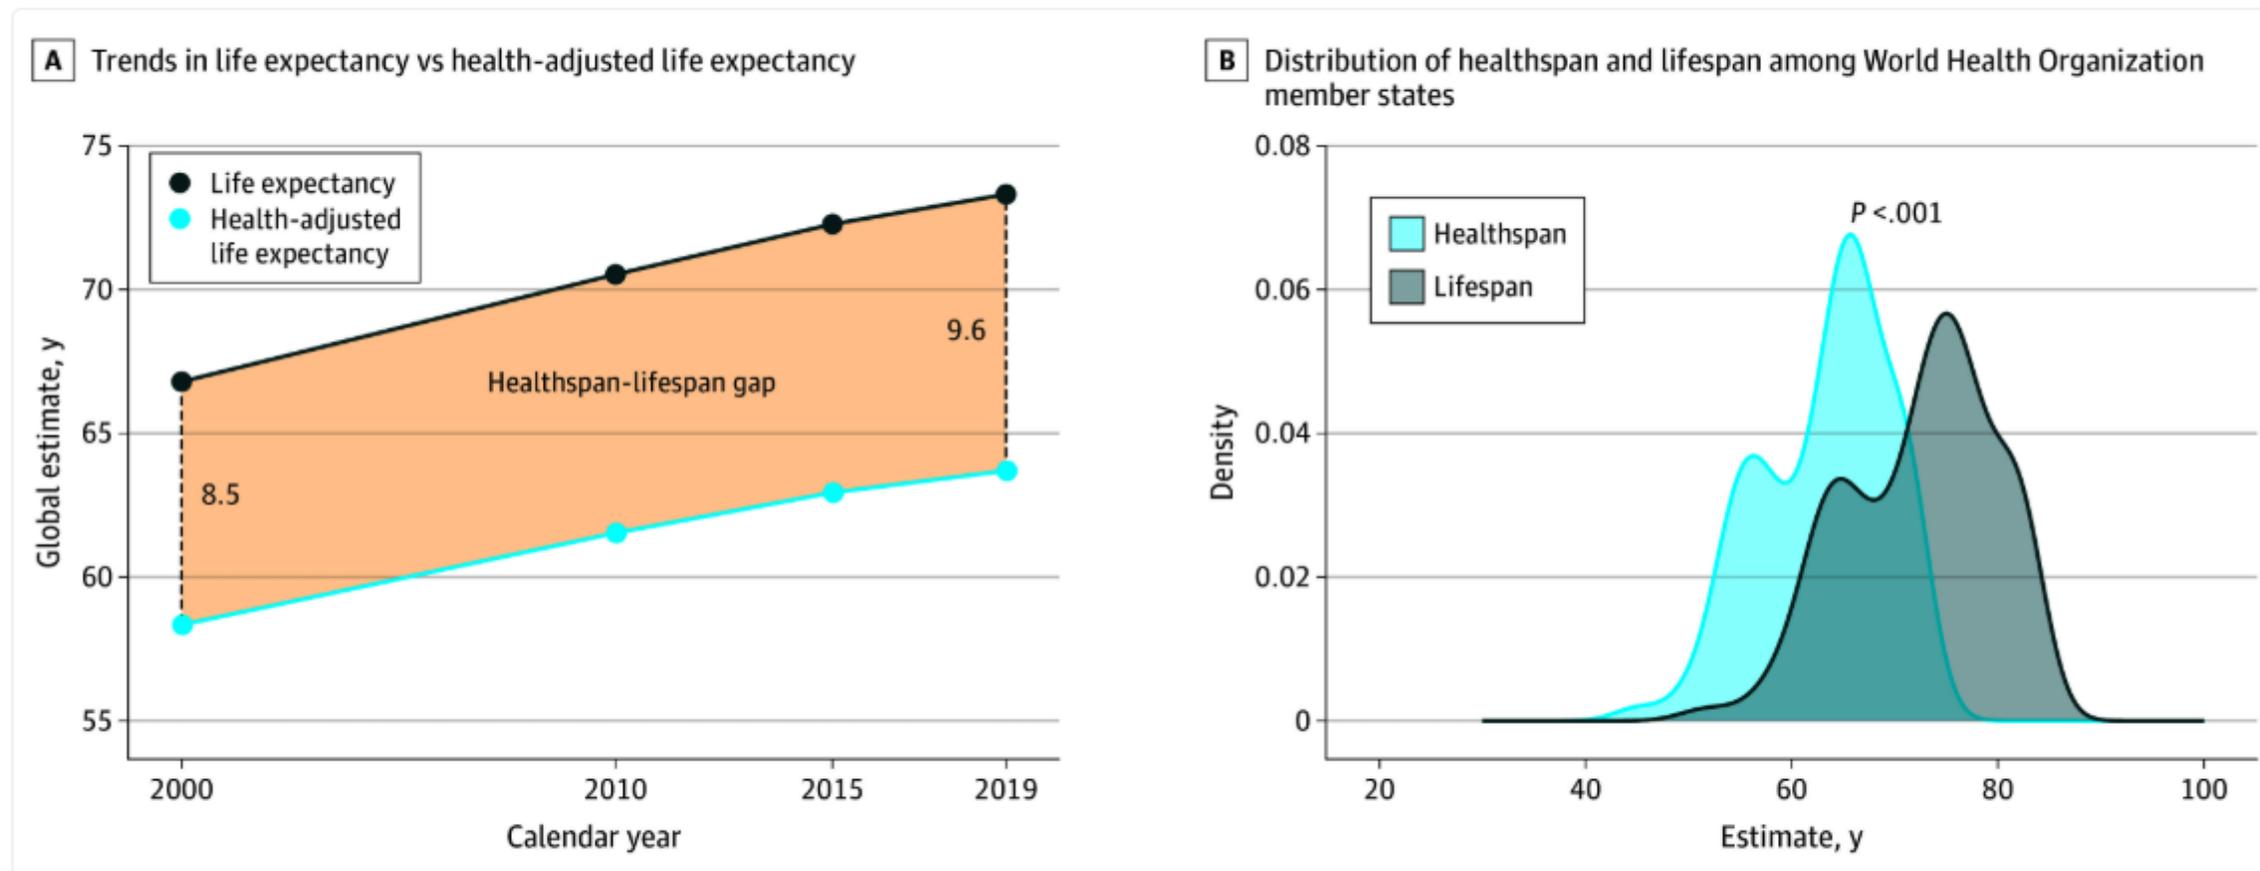

# Life expectancy

Period life expectancy<sup>1</sup> is the number of years the average person born in a certain year would live if they experienced the same chances of dying at each age as people did that year.

The number of years in good health in Canada

**Figure 1. Global Life Expectancy, Health-Adjusted Life Expectancy, and Healthspan-Lifespan Gap.**

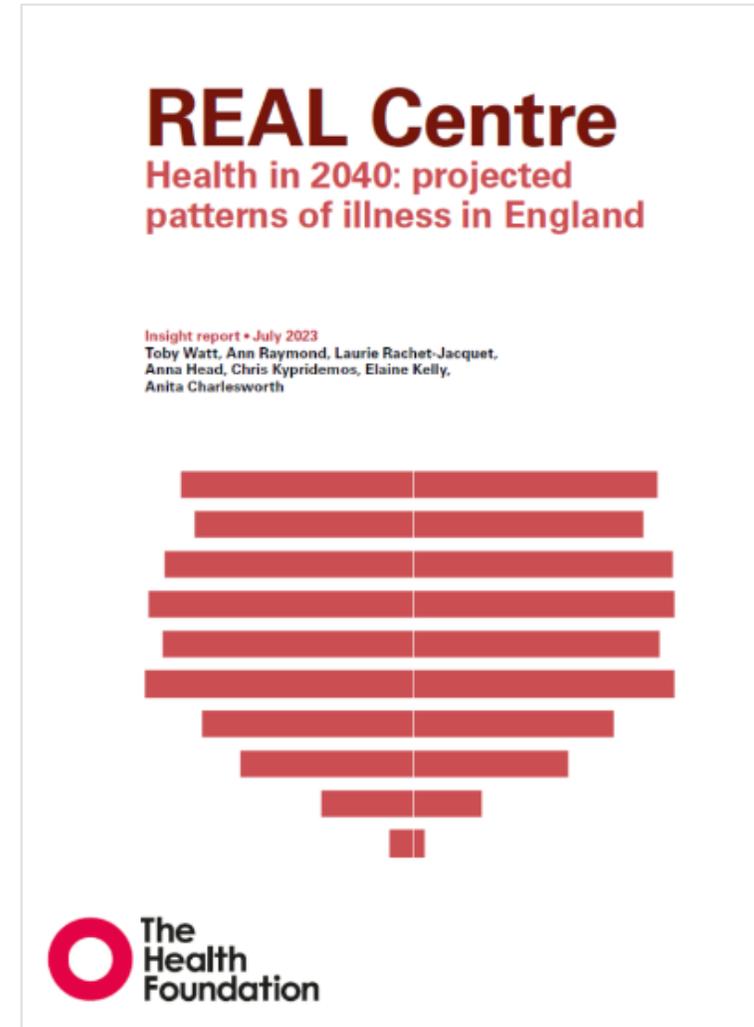

A, Trends of life expectancy, health-adjusted life expectancy, and healthspan-lifespan gap. B, Distribution of healthspan and lifespan among 183 World Health Organization member states.

# The Health Foundation – Projected Pattern of Illness in England

## New approach to projections – with U. Liverpool

- Health in 2040: First report from a long-term programme of research **in development with academic partners**
- **Better data**: Linked primary care, secondary care and mortality records with complete patient diagnostic history
- They model illness with **20 highly prevalent and/or high cost conditions** – summarized by the Cambridge Multimorbidity Score (CMS). “Major illness” is a score above a certain threshold (1.5)

# Factors affecting healthcare needs

We incorporate population data and projections on these factors

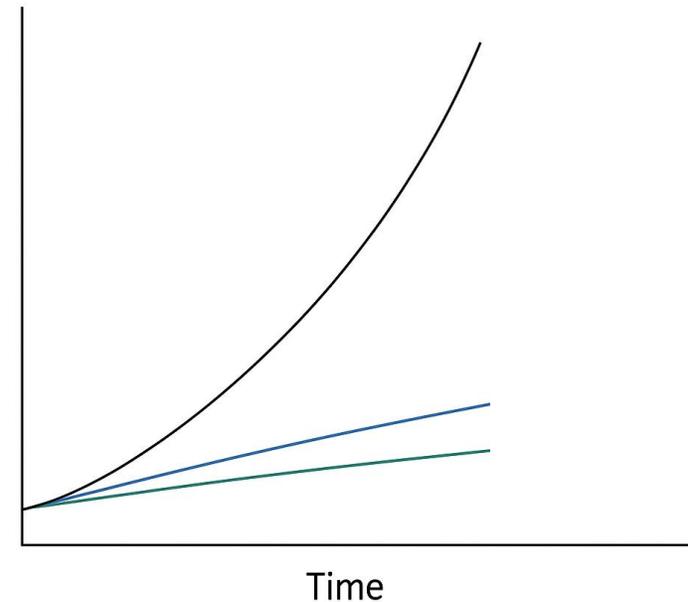

Projections based on robust epidemiologic & population patterns enable:

- Anticipating and planning for population health needs
- Informing policy and health system change
- Targeting mitigation and prevention strategies

# Projections that shift us into a planning mindset

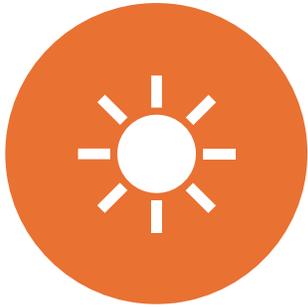

Tools for shaping policy choices and system readiness

- Proactive not reactive
- What would it take to change this trajectory?
- Exploring alternative futures based on different prevention, program & policy, scenarios.

# Long-term projections are standard practice in sectors responsible for long-term performance

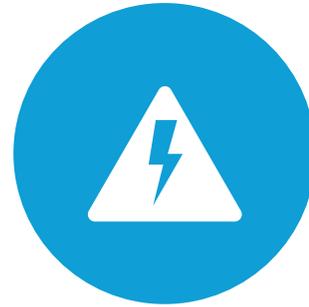

Used routinely to guide infrastructure, investment, and risk management

CLIMATE &  
ENVIRONMENTAL POLICY

URBAN PLANNING &  
TRANSPORTATION

ENERGY & UTILITIES

FINANCE & INSURANCE

# Projected patterns of illness in Ontario

Hospital  
Association

## How will the age structure of the population of Ontario change?

- Population will grow by 36% in Ontario
- Largest increase happening in 65+ age group
- Dependency ratio will be >50% by 2040

# Quantifying Burden of Illness in the Ontario Population

Measure 22 conditions that account for the majority of illness in the Ontario Population

We measure diagnosed conditions in the population and categorize using a modified Cambridge Morbidity Score (CMS)\*

Weighted score based on expected demand on health care system impact and impact on life expectancy

Divide the population into:

No illness

Some illness

Major Illness

## High-burden conditions in the 30+ population

Acute myocardial infarction (AMI)	Hypertension
Asthma	Osteo arthritis
Anxiety and mood disorders	Osteoporosis
Cancer	Renal failure
Cardiac arrhythmia	Rheumatoid arthritis
Chronic coronary syndrome	Schizophrenia and other psychotic disorders
COPD	Substance use disorders
Crohn's and colitis	Stroke
Congestive heart failure (CHF)	Constipation
Dementia	Epilepsy
Diabetes	Hearing loss

# Description of the morbidity groups

## No Illness

- Mean age: 31
- No major conditions

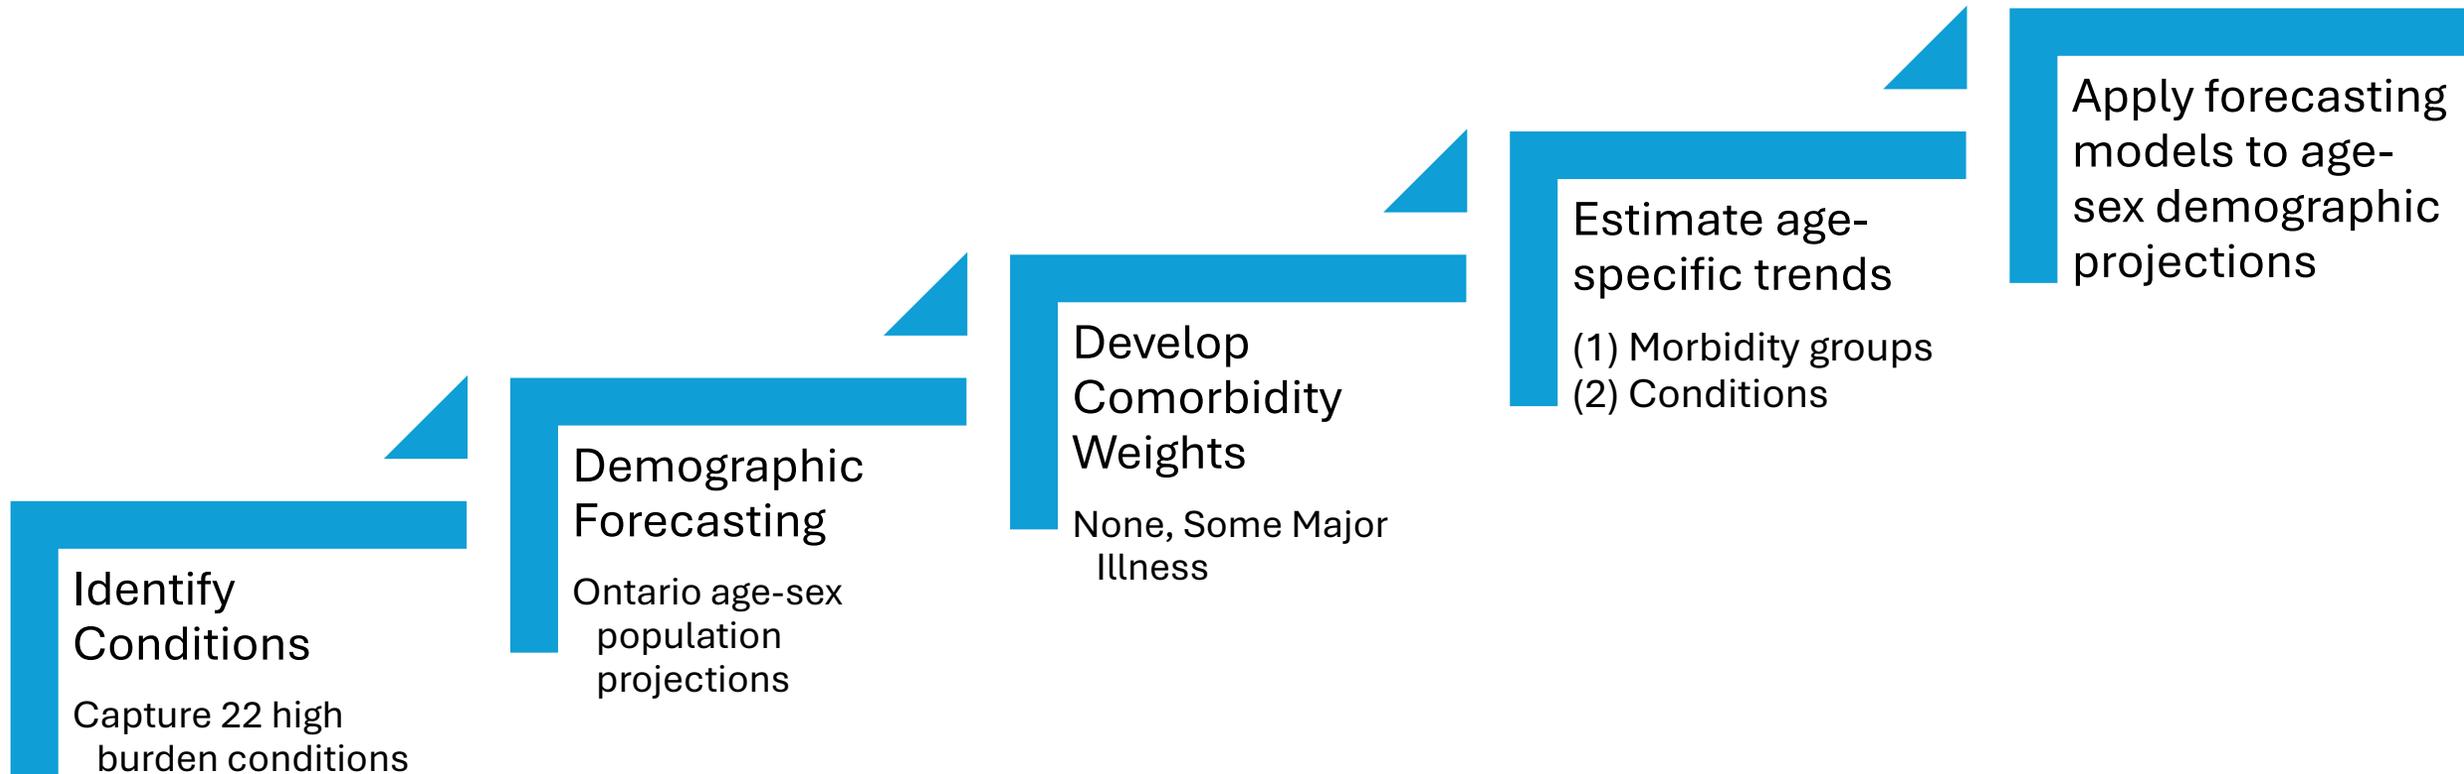

## Some Illness

- Mean age: 46
- Common conditions: Mood disorders (18%), Asthma (29%), Diabetes (8%)
- 0.5% with 3 or more chronic conditions

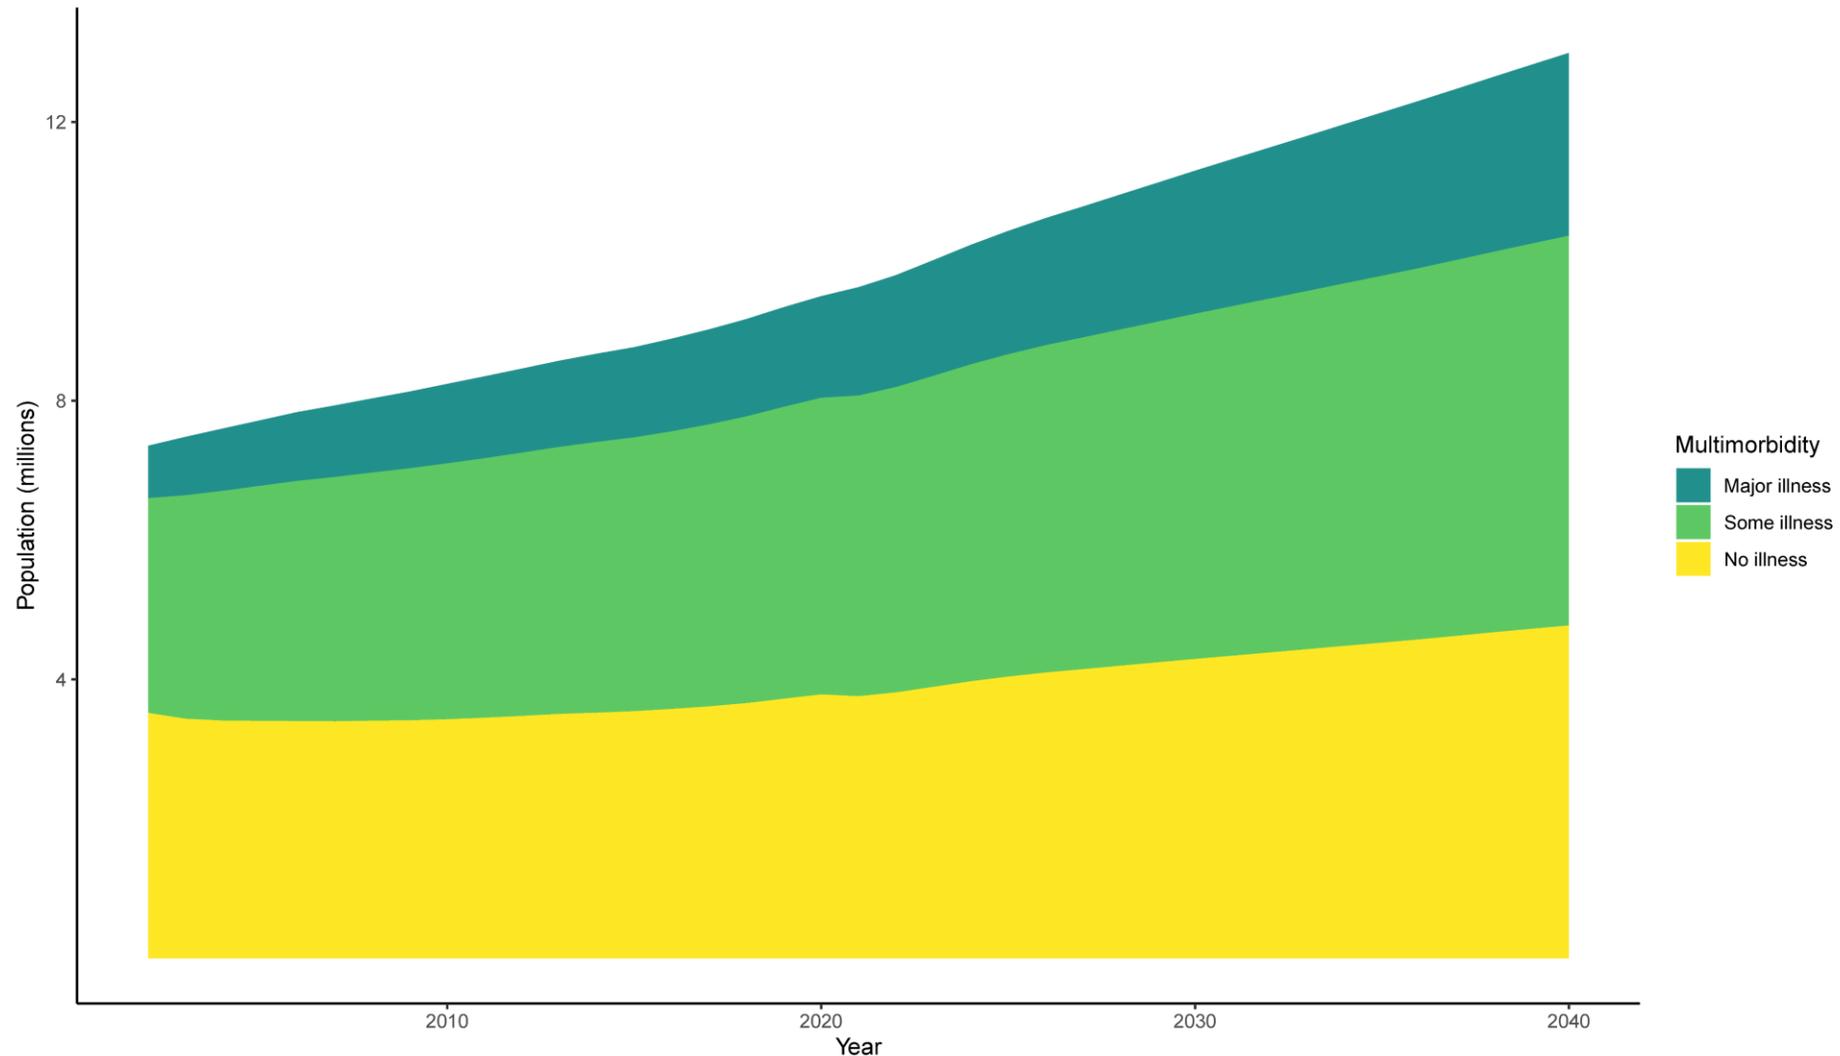

## Major Illness

- Mean age: 68
- Common conditions: Diabetes (41%), Cancer (21%), Dementia (8%), Stroke (12%)
- 66% with 3 or more chronic conditions

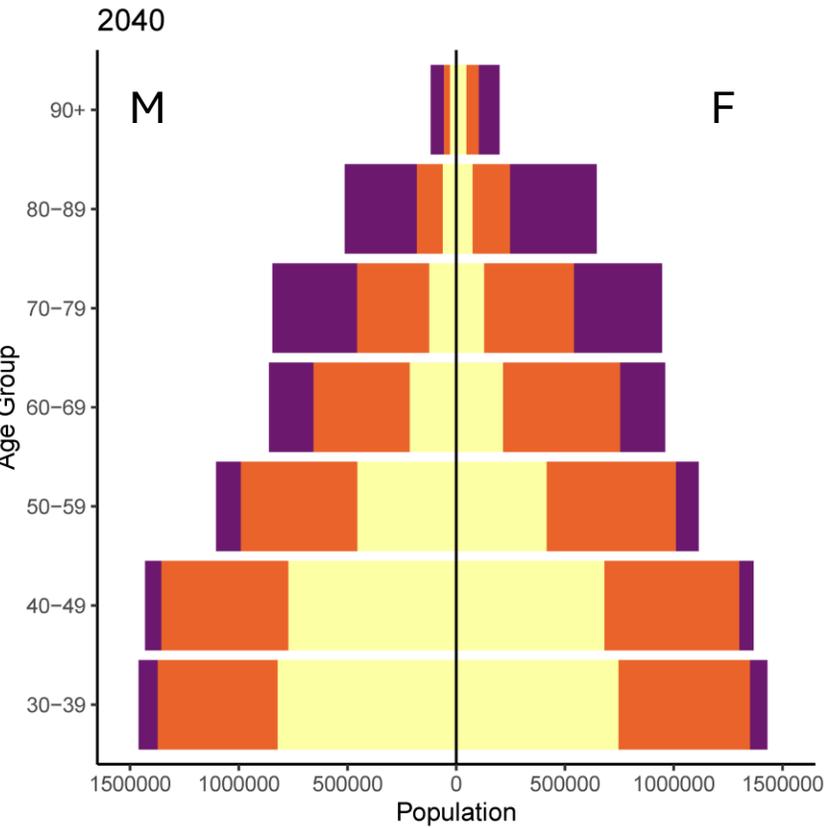

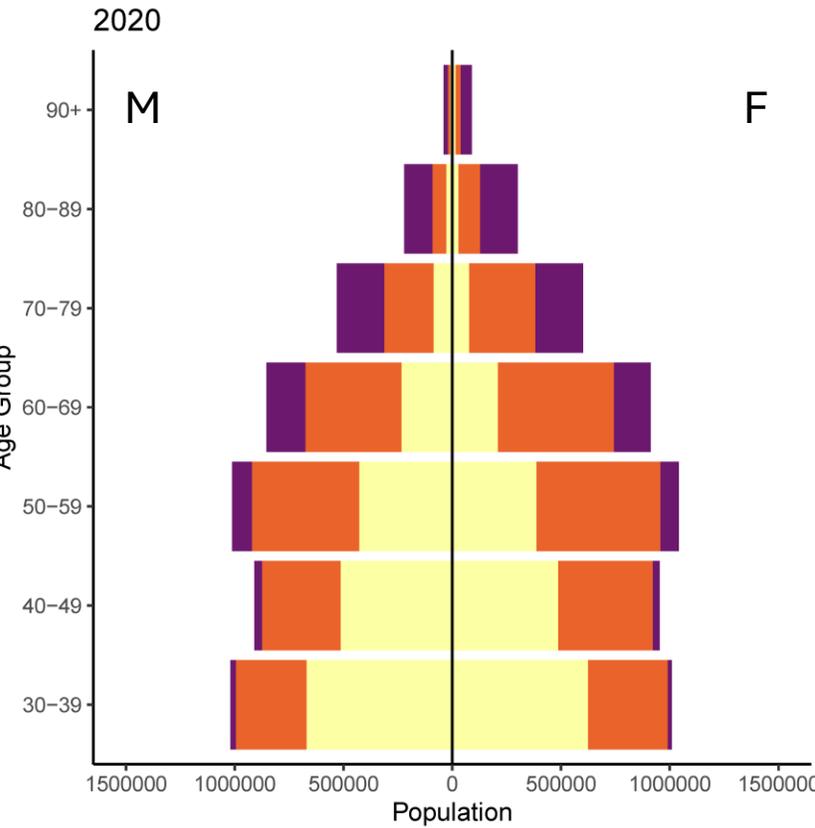

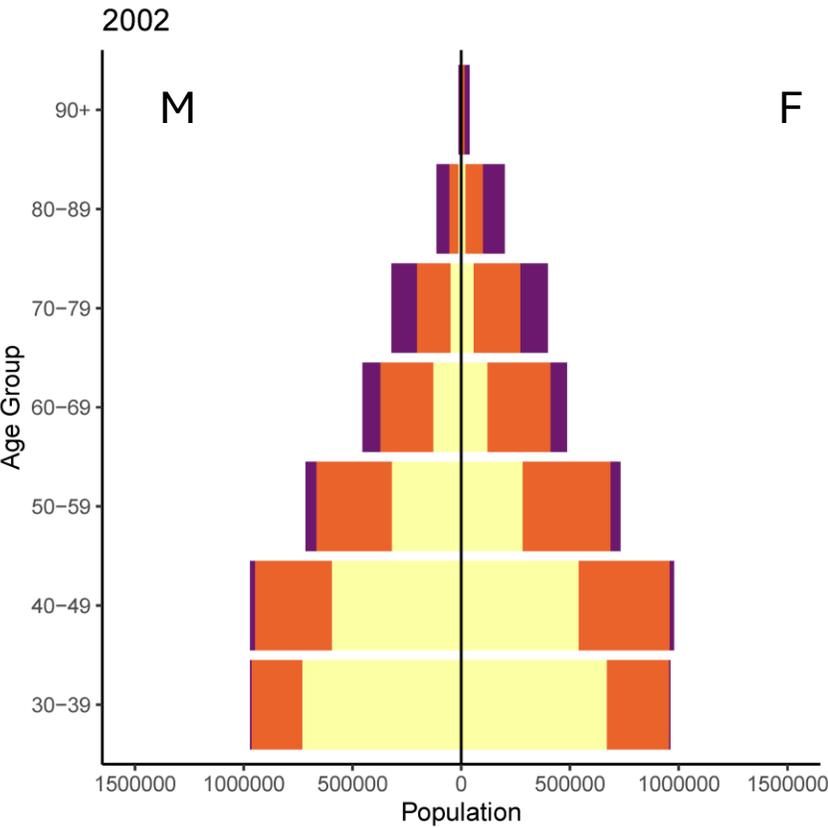

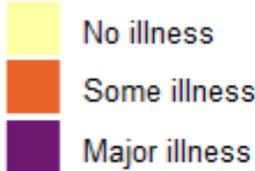

# Summary of approach

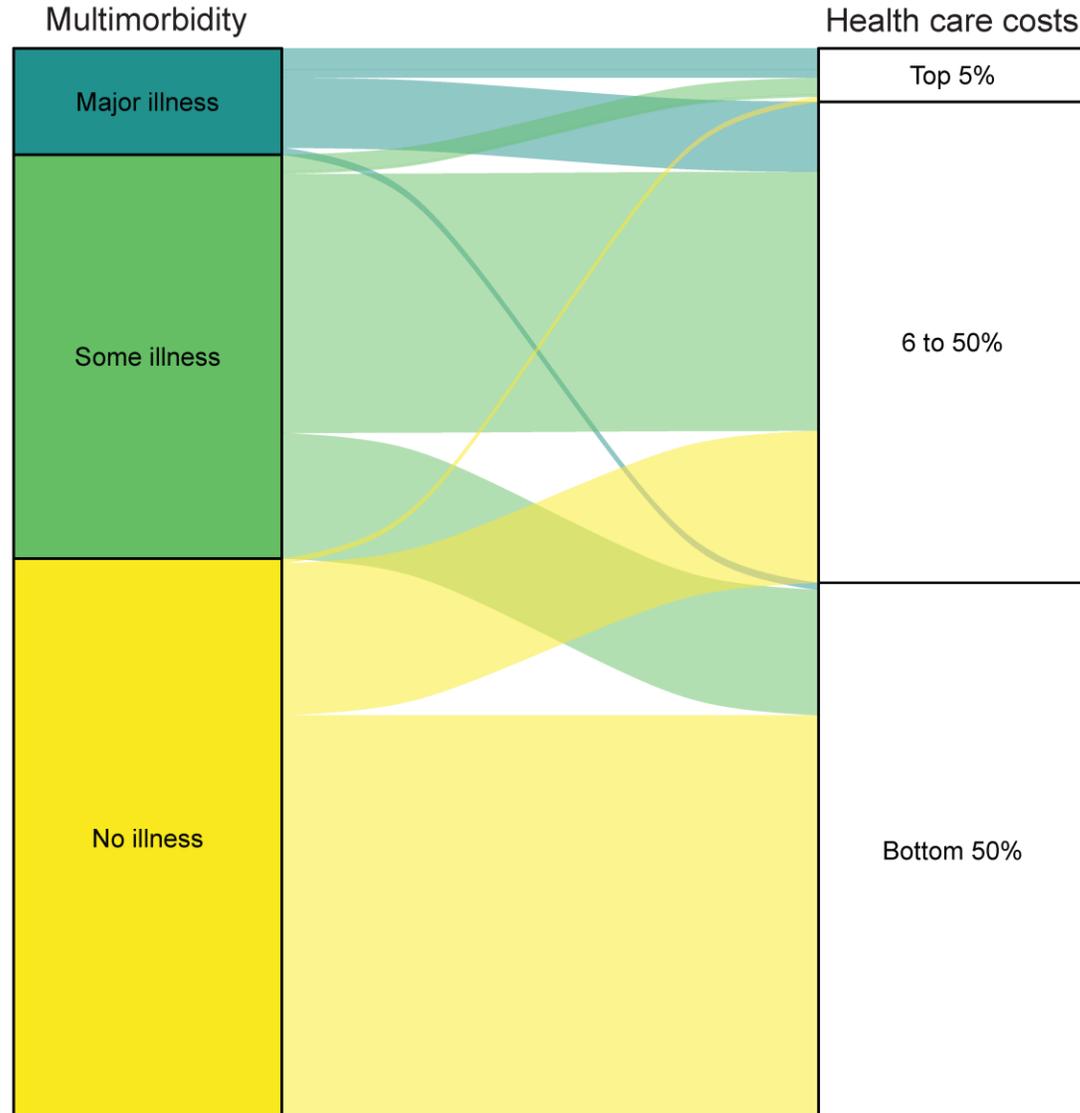

# The number of years people spend with illness is increasing

# Ontarians will be living longer with more major illness

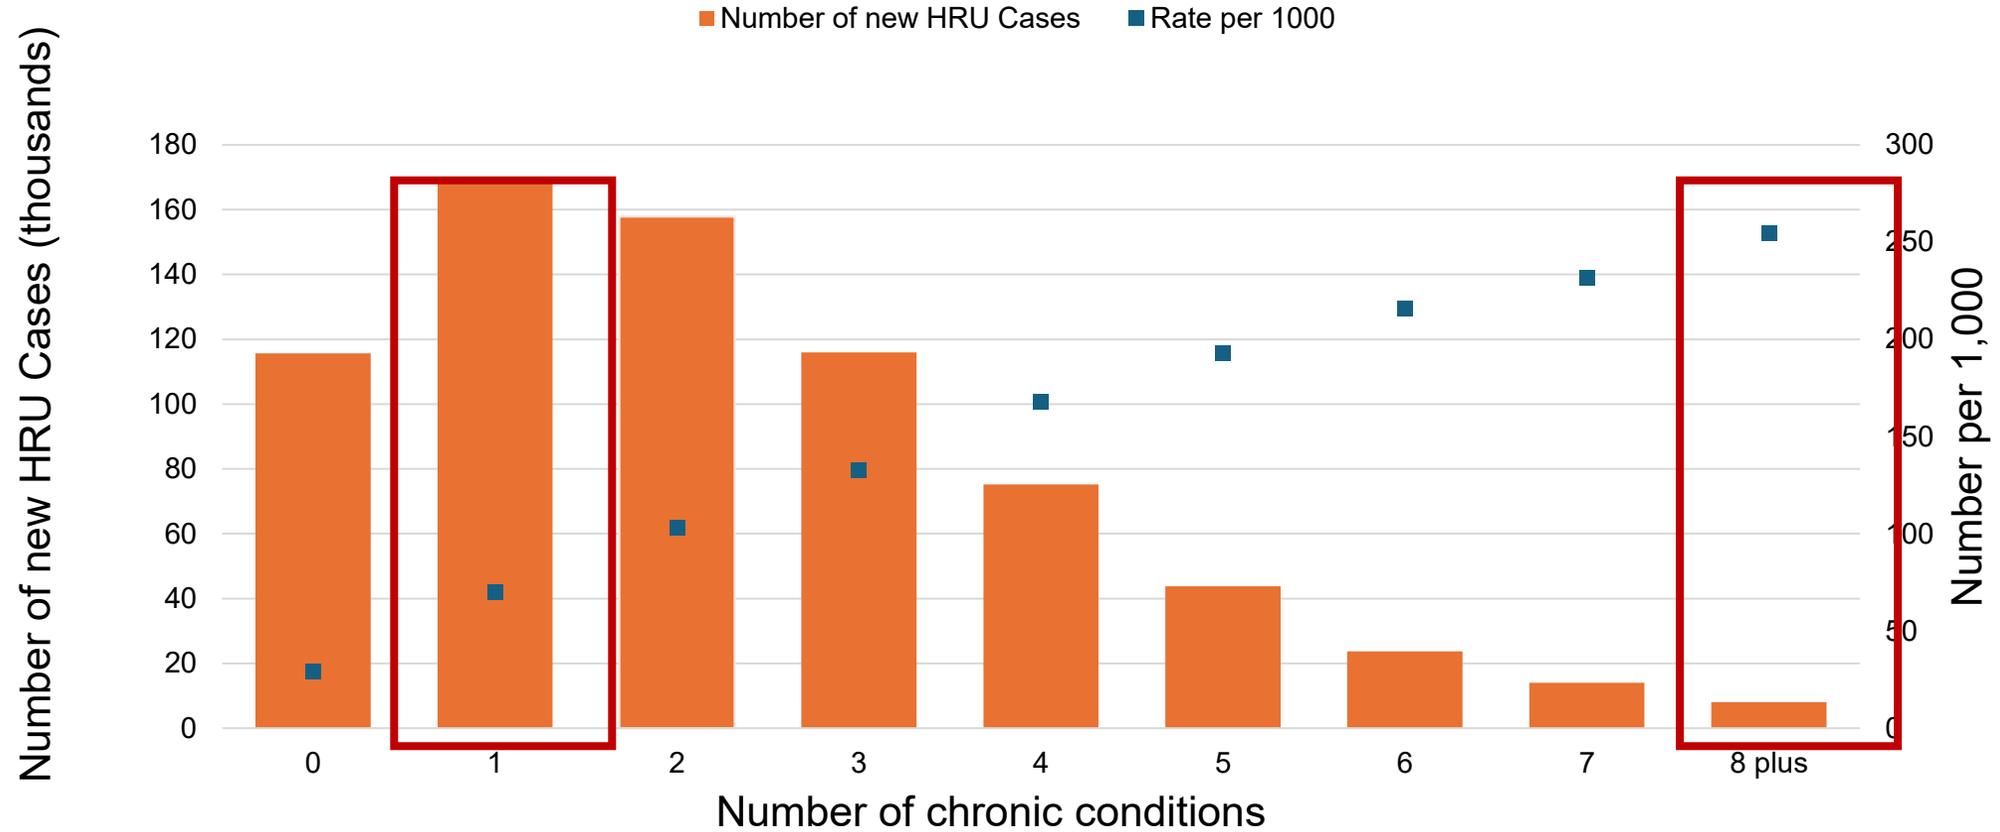

# Those with major illness will account for most of the healthcare resources

**Top 5% ~40K avg/person**

**Bottom 50% < \$1000 avg/person**

## Expected number and rate of high resource users in Ontario by number of chronic conditions (2013/14- 2018/19)<sup>1,2</sup>

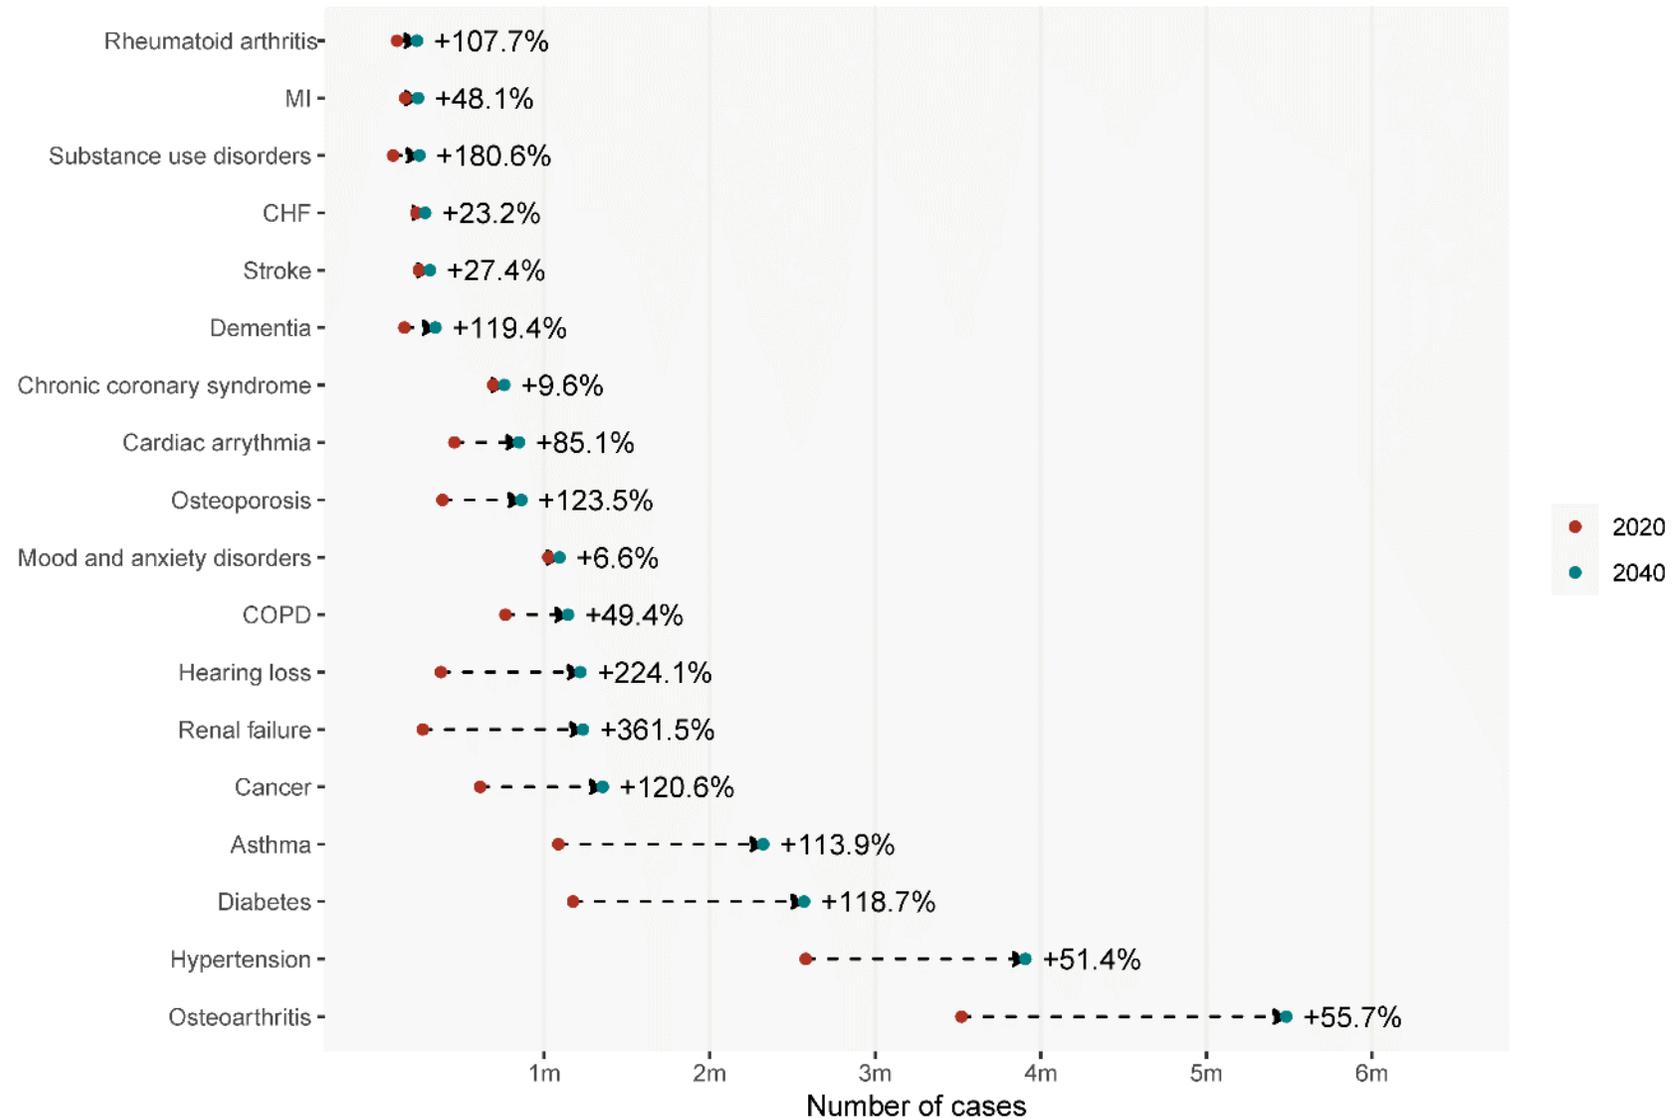

<sup>1</sup>Note: number of new HRU cases do not sum to 758,184 due to missing information on key stratification variables for some individuals.

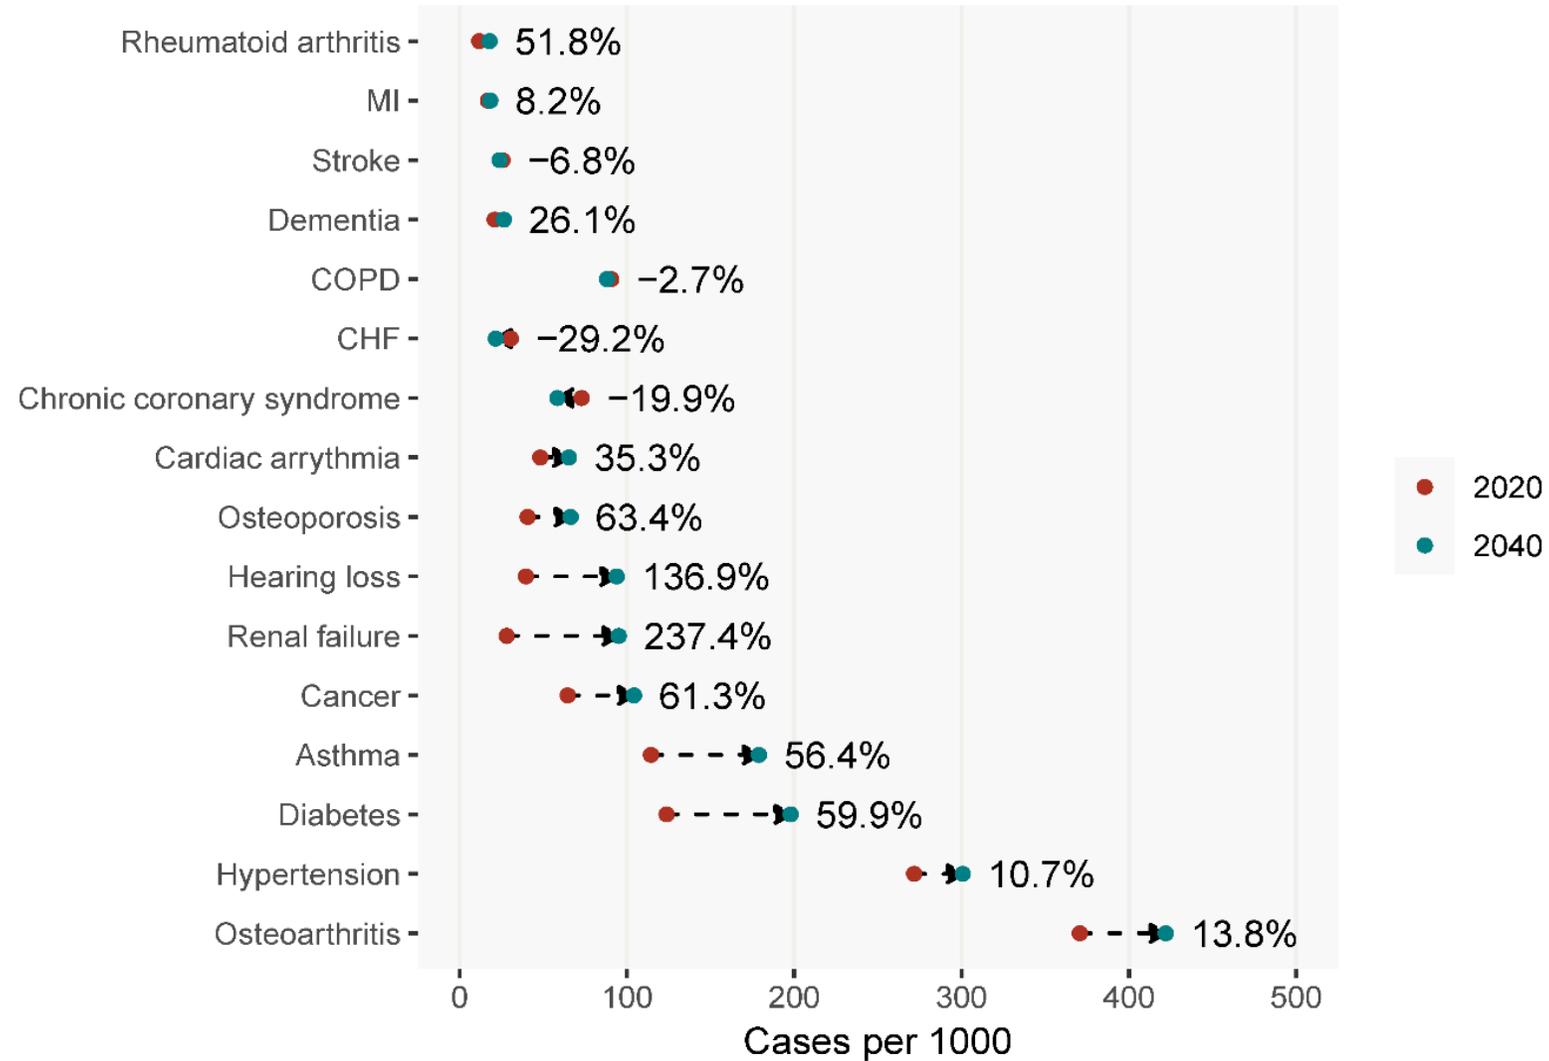

<sup>2</sup>Chronic conditions include self-reported asthma, arthritis, back problems, migraine headaches, chronic obstructive pulmonary disease, diabetes, hypertension, heart disease, cancer, stomach ulcers, stroke, urinary incontinence, bowel disorder, mood disorder, and anxiety disorders.

O'Neill M, et al. Predicting high healthcare resource utilization in Ontario, 2013/14-2018/19: Characterizing high resource users in Public Health Units. Toronto, ON: Population Health Analytics Lab; 2019.

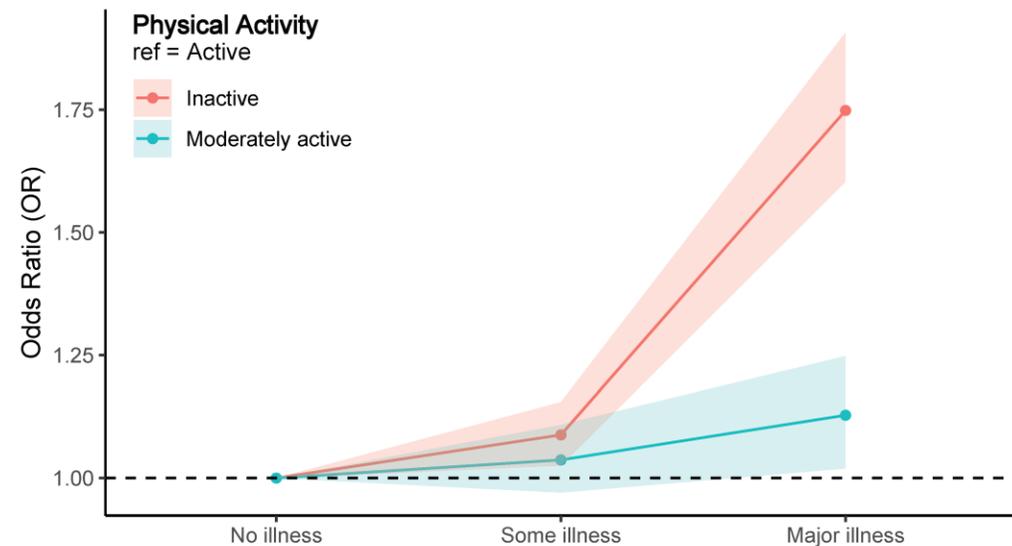

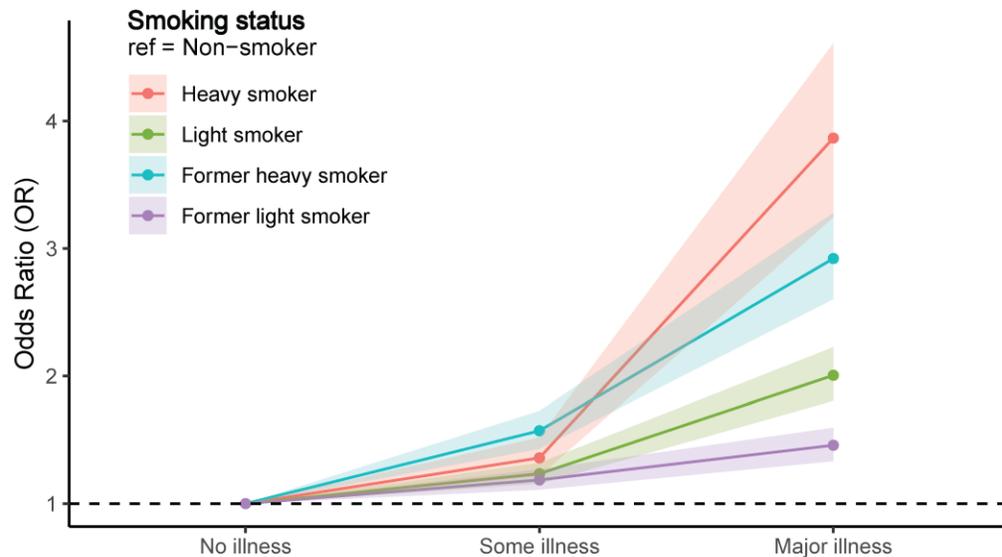

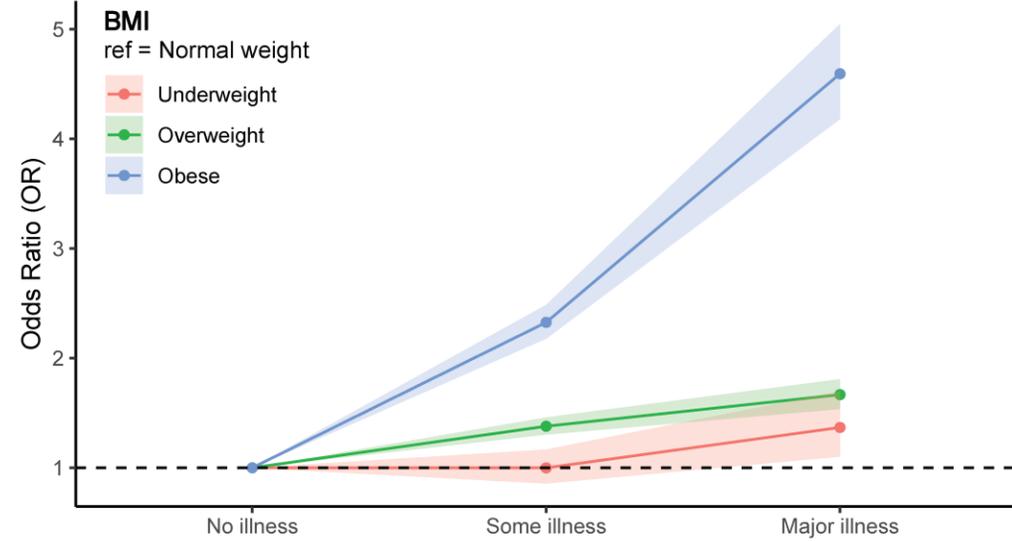

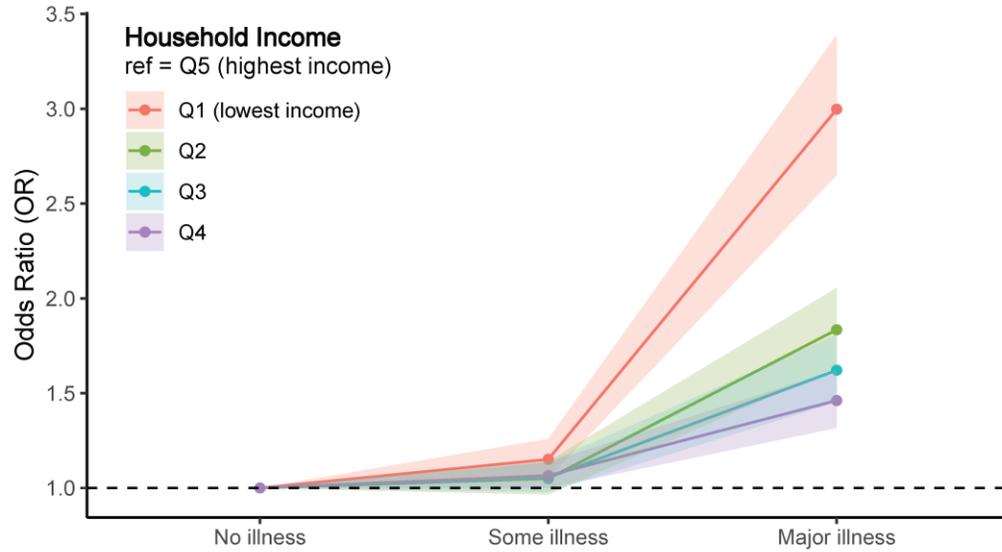

# Total number of cases increasing by condition

# Rates (per 1000) increasing by condition

# Strong determinants of risk groups

# Implications for the Ontario Health System

Approaching a  
tipping point in  
illness burden

- The burden of illness and subsequent strain on the system will be **increasing considerably** in the next two decades

Ontarians are  
living longer  
with more illness

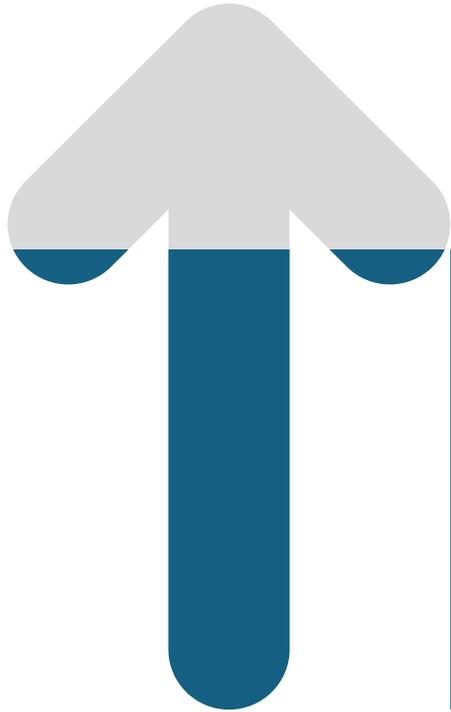

- Many of conditions can be managed outside hospital
- This burden **will not be equally felt** in the population
- Many chronic disease can be **prevented or postponed**

Prevention &  
Community

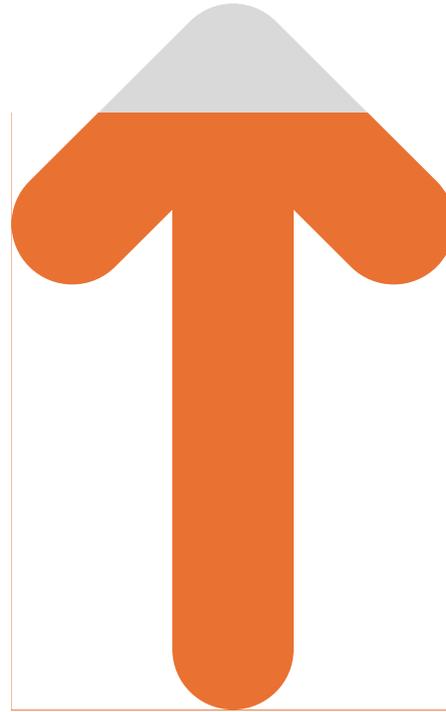

- Important opportunities for **prevention** and postponing major illness
- Increased focus on **community care** and the determinants of health

# The drivers of increasing future health care needs are known

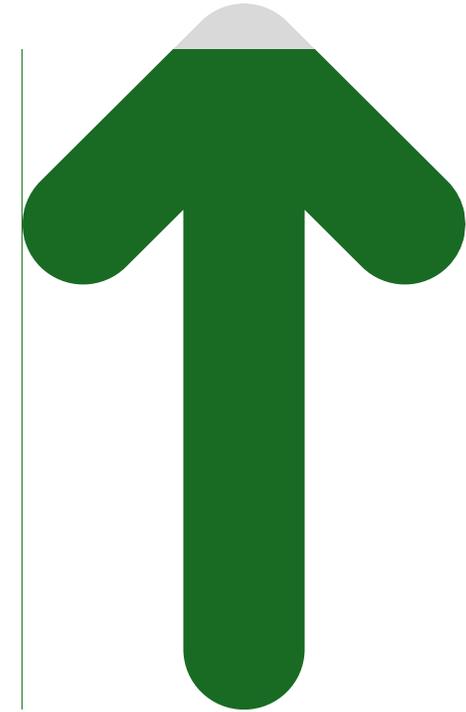

## **Ageing Population**

The number of people living over 70 will increase steadily and considerably in the next 2 decades

## **Individual Factors**

Physical activity, healthy food, obesity, social support

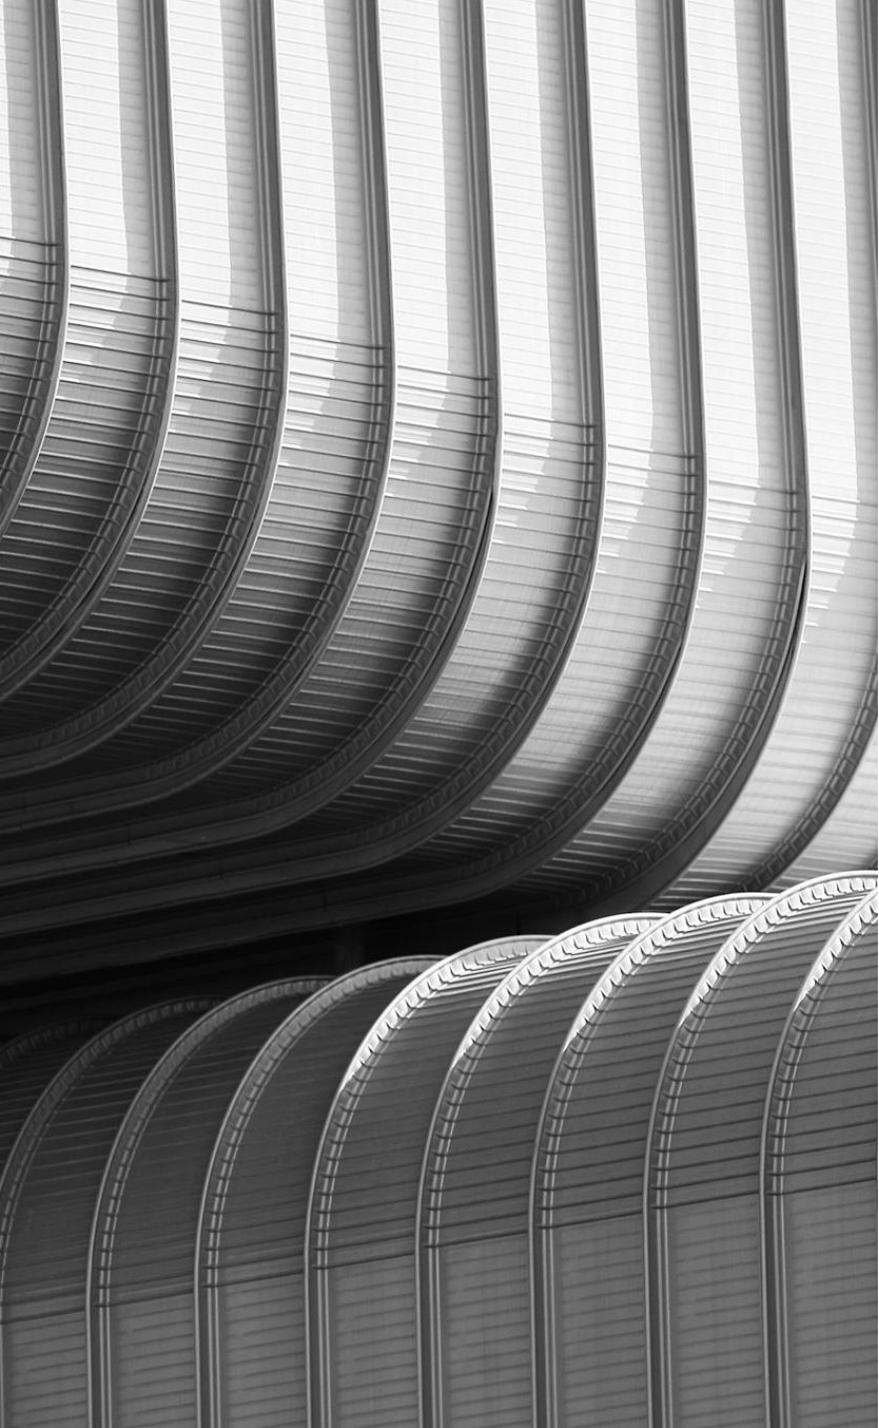

## **Social and Structural factors**

Social and structural determinants of health will increase health needs, especially among younger ages, increasing the number of years lived in poor health

# The Tipping Point

# **Without intervention, the system is not simply strained; it becomes structurally non-resilient**

Chronic disease growth is as destabilizing to the system as acute shocks, only slower and harder to reverse

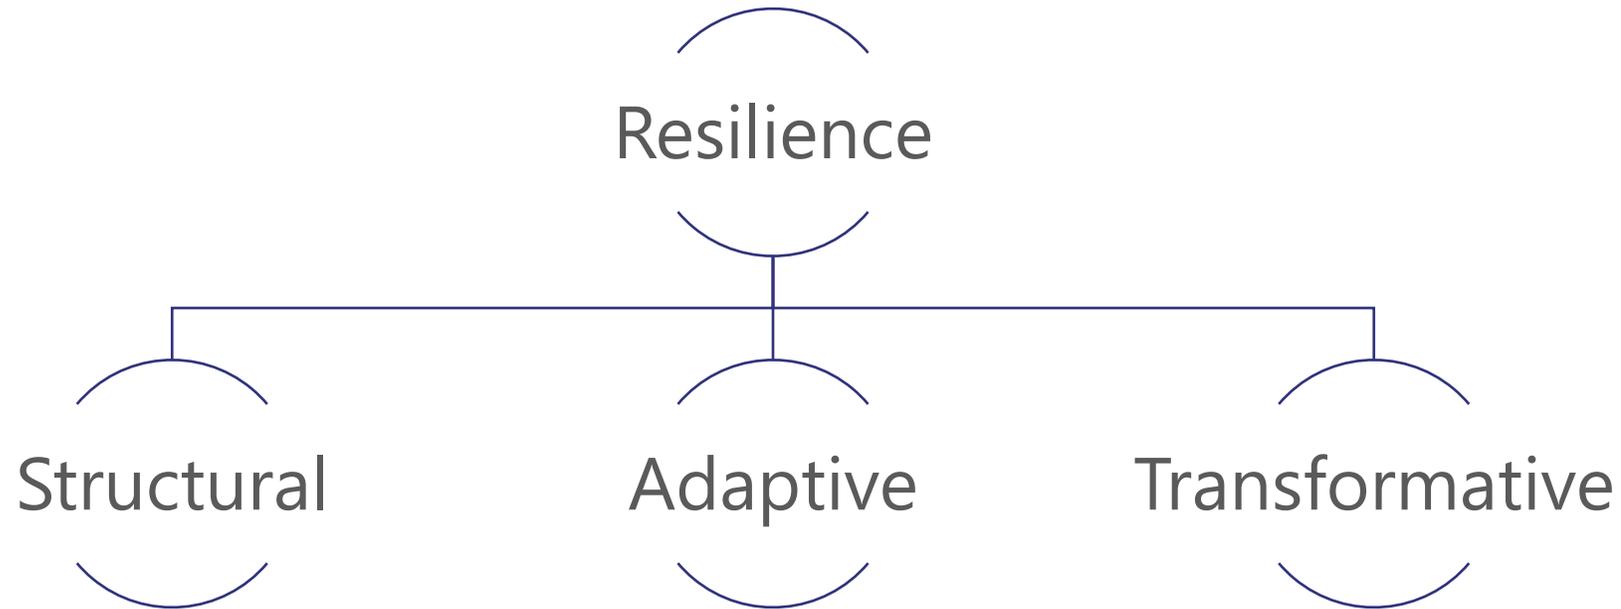

Rising multimorbidity reduces system agility and increases vulnerability during crises

Resilient health systems must anticipate both sudden shocks and chronic pressures

Strengthening prevention and community health infrastructure is foundational to system resilience

# Resilience

The ability to recover or adjust to shocks

**Can we absorb the shock?**

**Can we adjust during the shock?**

**Can we emerge stronger?**

Transformative

System redesign

Adaptive

Public health  
action

Structural

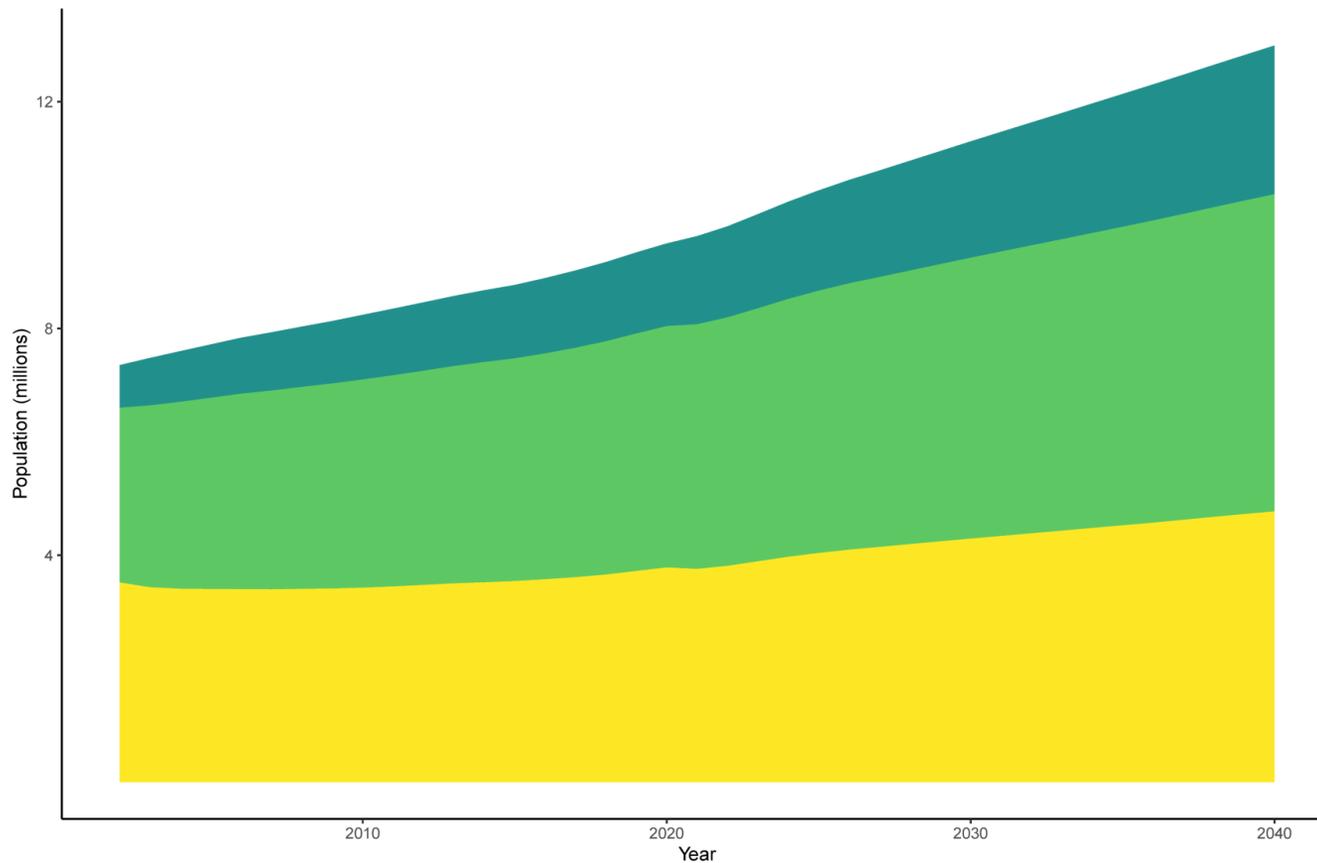

Manage rising  
burden

- +
- 
- 

What Does this  
mean for public  
health?

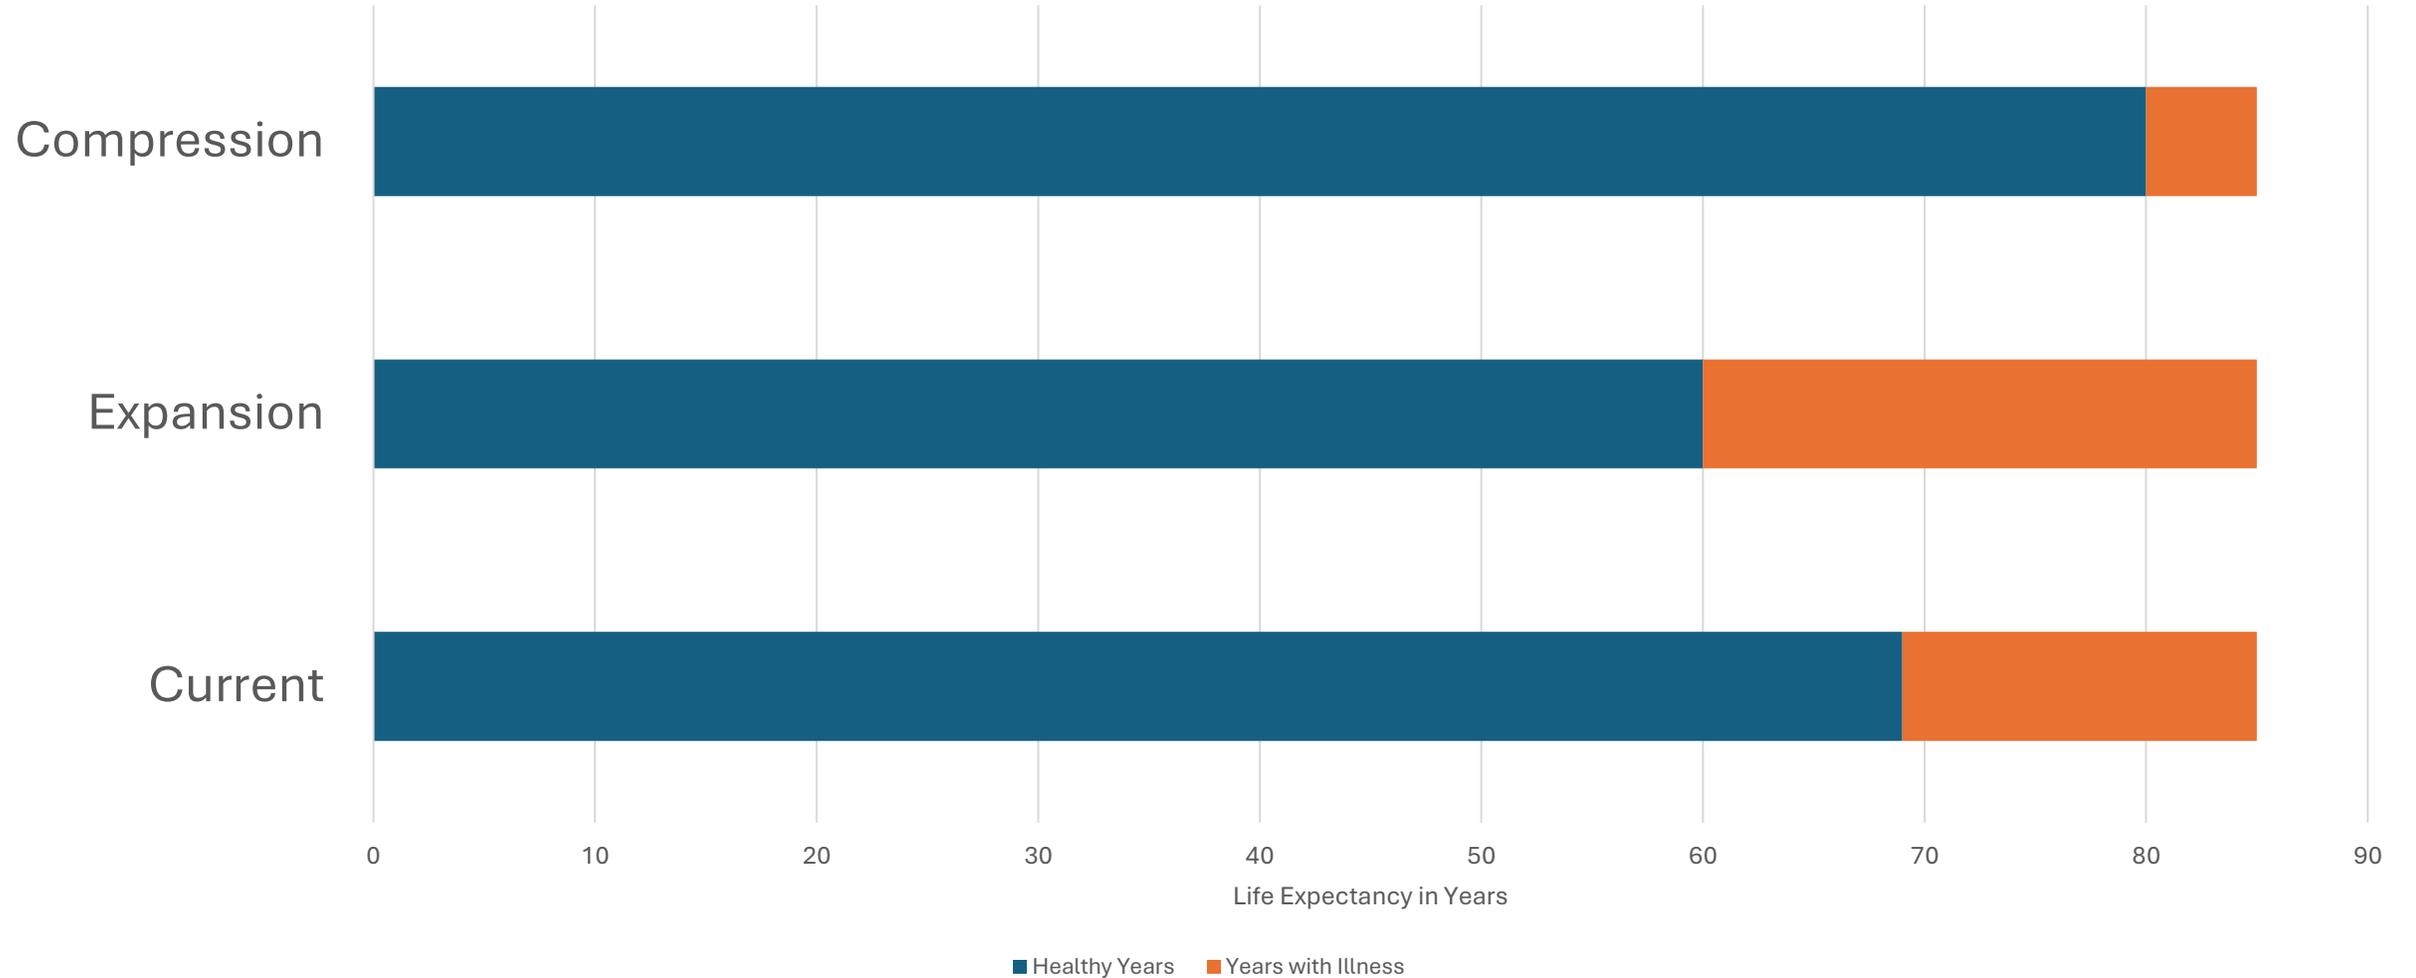

# Bending the curve: The role of public health

- Ontario is now entering the decade where prevention has the highest leverage
- Demographic momentum means that by 2035, our ability to change 2040 outcomes declines sharply
- Chronic disease is now a resilience threat, not just a health or system burden

# Goal: Living more years of healthy life

# National Goals: Extending Life vs. Extending Healthy Life

## Lifespan Goals

- Achieve the highest life expectancy
- Increase total life expectancy (e.g., target of 85 years)
- Reduce mortality and extend survival

VS

## Healthspan Goals

- Add 5 years of healthy, independent life
- Extend healthy life expectancy (disease-free, functional years)
- Narrow the gap between lifespan and healthspan

# How public health turns projections into prevention

## Identify priority risks and conditions

Highlight conditions, risks, and inequities needing most attention

## Set meaningful prevention targets

Align indicators with the timelines where prevention can realistically bend the curve

## Equip regions for focused local action

Provide localized forecasts to tailor programs, planning, and resource allocation

## Strengthen accountability

Use indicators and scorecards to track progress and demonstrate impact

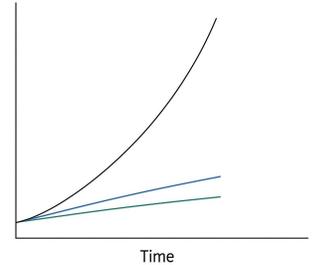

---

## System Alignment and Action

- **Align decision-making across ministries, PHUs, municipalities, and health system partners**  
Use shared projections to coordinate priorities and expectations.
- **Support long-range system planning**  
Inform budget cycles, workforce planning, infrastructure needs, and prevention investment.
- **Guide regional prioritization**  
Help identify where pressures will emerge and where early intervention has the greatest effect.
- **Enable transparent accountability for outcomes**  
Use projections as a reference point to assess progress and the cost of inaction.

# Public health levers that bend the curve

Healthy built environments (walkability, transportation, greenspace)

Tobacco and alcohol policy

Food environments & nutrition security

Housing stability and neighbourhood conditions

Physical activity opportunities

Early-life interventions

Community design for aging populations

Equity-focused approaches

**Figure 1:** Building Blocks of Healthy & Resilient Cities

## Social Connections

Cities have a critical role in supporting and building social connections, which underpin health system resilience

## City Infrastructure

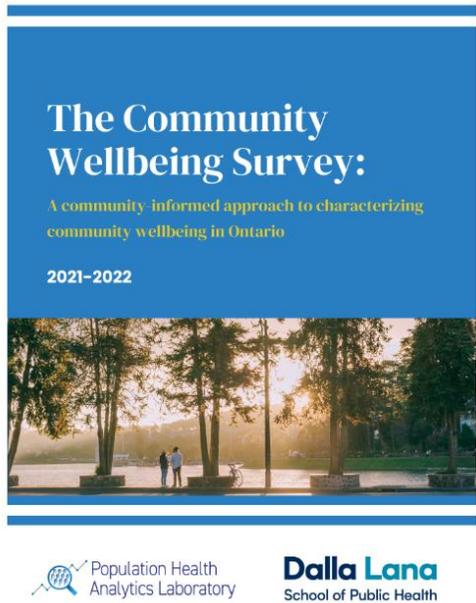

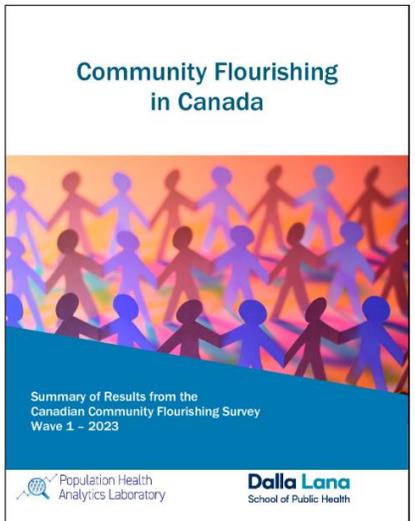

Robust physical infrastructure is needed in flexible ways before, during and after health threats

## Local organizations

City government, local health system organizations and community-based organizations are pivotal in enabling an equitable and effective response and longer-term rebound

# What's next for this work

Patterns of illness among children and young adults

Partnership with PHO

Health region-specific forecasts in Ontario to support local system planning.

Partnership with other provinces

Patient, community , community & partnership tables

Integrating the social determinants and risk factors to inform prevention indicators

Monitoring, interventions, system planning approaches and local action

## What success looks like

More years of healthy life

Later onset of multimorbidity

Narrowing socioeconomic gradients

Slower disease burden curve

# How we get there

## Build

Develop shared, province-wide foresight models that give all partners a common view of future burden and system needs

## Use

Apply projections to guide long-range public health investment; setting targets, aligning priorities, and focusing prevention for population impact

## Strengthen

Deepen partnerships with cities, communities, and sectors that shape the determinants of health, so action aligns with the real drivers of illness and inequity

# Main Messages

---

Ontario's burden of illness is rising to unprecedented levels

---

Public Health has distinct levers to influence that trajectory

---

Projections provide focus, alignment, and accountability for action

---

Data + modelling + indicators enable targeted local action

---
