Alt. treatments only if first-line not possible and must have a test of cure.

Any of these therapies:

- **Cefixime** 400mg PO PLUS Azithromycin 1g PO
- **Gentamicin** 240mg IM in 2 separate 3-mL IM injections of 40mg/mL PLUS Azithromycin 2g PO
- **Azithromycin** 2g PO monotherapy

---

### First-line Treatment

Ceftriaxone 250mg intramuscular (IM) PLUS Azithromycin 1g by mouth (PO), given at the same visit.

### Alternative Treatments

Only if first-line not possible and must have a test of cure.

Any of these therapies:

- **Cefixime** 400mg PO PLUS Azithromycin 1g PO
- **Gentamicin** 240mg IM in 2 separate 3-mL IM injections of 40mg/mL PLUS Azithromycin 2g PO
- **Azithromycin** 2g PO monotherapy

### First-line Treatment in Pregnancy

Must have follow up, including test of cure.

Ceftriaxone 250mg IM PLUS Azithromycin 1g PO, given at the same visit. If first-line treatment is not possible, consider consultation with a specialist.

### Follow-up Recommendations

(assuming no ongoing signs/symptoms and no re-exposure).

**Test of Cure:** Recommended if first-line therapy is not used, pregnancy, pharyngeal infection and other clinical situations. (Please see the [Ontario Gonorrhea Testing and Treatment Guide](https://www.oahpp.ca) for a full list).

- Culture is first-line (3-7 days post-treatment)
- Nucleic acid amplification test (NAAT) is second-line (2-3 weeks post-treatment)

**Re-screen:** All cases should be re-screened 6 months after treatment.

**Report:** Suspected or confirmed gonorrhea treatment failures must be reported to the health unit.

---

**Footnotes:**

- Gemifloxacin 320mg PO PLUS Azithromycin 2g PO is an alternative treatment but it is currently unavailable in Canada. Once available in the United States, it will be accessible in Ontario through Health Canada’s Special Access Program.

- Alternative treatments are not as effective as first-line therapy using ceftriaxone and azithromycin. The use of cefixime can also accelerate resistance to ceftriaxone, threatening the usefulness of the last potent antibiotic for gonorrhea.

- Azithromycin monotherapy is the least preferred option due to reduced susceptibility of *N. gonorrhoeae* isolates to azithromycin in Ontario and evidence in support of dual therapy.
