Coronavirus Disease 2019 (COVID-19), Influenza, & Respiratory Syncytial Virus (RSV)

Updated weekly on Tuesdays, and current as of 3:00 p.m. on the date it was posted.

Note: As of October 17, 2023 this document will include updates for other respiratory diseases of public health concern, primarily influenza and respiratory syncytial virus (RSV).

Additionally, the “Guidelines and Technical documents” section [last updated July 26, 2023] will no longer be updated, but is archived as an appendix at the end of this document.

Moving forward, any news and guidance updates will be cycled through the New Content section below, as always with the dates of the latest additions bolded.

This document is a collation of resources for your reference. For official guidance on COVID-19, Influenza, and RSV in Ontario, please visit the Ministry of Health (COVID-19 | The Flu | RSV).

Public Health Agencies

Public Health Agency of Canada | canada.ca
Beginning the week of December 6, 2021, Library Services switched from reporting daily to weekly COVID-19 trends. For daily COVID-19 case counts, you can check 2019 novel coronavirus: outbreak update, or COVID-19 vaccination in Canada for vaccination rates.

- NACI. Updated guidance on influenza vaccination during pregnancy [12-18-2023]
  - Summary of National Advisory Committee on Immunization (NACI) supplemental statement of December 18, 2023 [12-18-2023]
- COVID-19 activity levels [updated 01-09-2024]
- Key COVID updates [updated 01-09-2024]
  - Weekly change in cases: 10,167
  - Total cases: 4,891,249
  - Weekly change in deaths: 79
  - Total deaths: 57,274
  - Weekly tests reported: 45,408
  - Weekly percent positivity: 15.7%
- Weekly influenza reports [updated 01-08-2024]
  December 10, 2023 to December 30, 2023 (weeks 50-52)
  - At the national level, influenza activity has continued to increase. Most surveillance indicators are increasing but remain within expected levels typical of this time of year.
- Virologic
  - In week 52, the percentage of tests positive for influenza was 18.9% and a total of 7,587 laboratory detections (7,373 influenza A and 214 influenza B) were reported.
- Syndromic
  - The percentage of visits for influenza-like illness (ILI) was 1.8% in week 52. The percentage of visits for ILI is within levels typical of this time of year.
  - The percentage of FluWatchers reporting cough and fever was 3.0% in week 52. The percentage of FluWatchers reporting cough and fever is within levels typical of this time of year.
- Respiratory virus report, week 50 - ending December 16, 2023 [updated 12-21-2023]
- COVID-19 daily epidemiology update [updated regularly]
- Respiratory virus detections in Canada [updated regularly]

BC Centre for Disease Control | bccdc.ca

- Respiratory surveillance report to health professionals in BC. Re: update: increased influenza activity and associated pediatric deaths in BC [01-04-2024]
- Epi week 52: Dec 24 to 30, 2023 [updated 01-04-2024]
  - Influenza A and RSV activity continues to increase; COVID-19 activity remains stable or decreasing since early November
- COVID-19 situation report [updated 01-04-2024]
- Genomic surveillance [updated 01-04-2024]
- **Respiratory season reports** [updated regularly]
  - **Respiratory epidemiology summary – week 52** [01-04-2024]

- **Conditions de faisabilité et utilité de la surveillance de la COVID-19 à l’aide du monitorage du SRAS-CoV-2 dans les eaux usées – Mise à jour 2023** [12-22-2023]

**CDC: Centers for Disease Control and Prevention | cdc.gov**

- **COVID-19 activity increases as prevalence of JN.1 variant continues to rise** [01-05-2024]
  - As the new year takes off, CDC continues to track the rise of JN.1 across the country. An offspring of BA.2.86, JN.1 is now the most widely circulating variant of SARS-CoV-2 in the United States and globally. At this time, there is no evidence that JN.1 causes more severe disease.
  - As of January 5, 2024, JN.1 is estimated to account for approximately 62% (range 55-68%) of all currently circulating SARS-CoV-2 variants, an increase from the estimated prevalence of 44% (range 39-50%) two weeks ago. CDC is also observing an increase in the prevalence of JN.1 in international travelers and wastewater viral levels, as well as in most regions around the globe.
- **Weekly U.S. influenza surveillance report** [updated 01-05-2024]
  - Seasonal influenza activity is elevated and continues to increase in most parts of the country.
  - Outpatient respiratory illness has been above baseline nationally since November and is above baseline in all 10 HHS Regions.
  - The number of weekly flu hospital admissions continues to increase.
  - During Week 52, of the 651 viruses reported by public health laboratories, 581 (89.2%) were influenza A and 70 (10.8%) were influenza B. Of the 342 influenza A viruses subtyped during Week 52, 300 (87.7%) were influenza A(H1N1) and 42 (12.3%) were A(H3N2).
  - Seven influenza-associated pediatric deaths were reported during Week 52, bringing the 2023-2024 season total to 27 pediatric deaths.
  - CDC estimates that there have been at least 10 million illnesses, 110,000 hospitalizations, and 6,500 deaths from flu so far this season.
  - CDC recommends that everyone 6 months and older get an annual flu vaccine as long as influenza viruses are spreading. Vaccination now can still provide benefit this season.
  - There also are prescription flu antiviral drugs that can treat flu illness; those should be started as early as possible and are especially important for higher risk patients.
- **Respiratory Virus Data Channel weekly snapshot** [updated 01-05-2024]
  - The amount of respiratory illness (fever plus cough or sore throat) causing people to seek healthcare is elevated or increasing across most areas of the country. This week, 39 jurisdictions experienced high or very high activity.
- **Severe viral respiratory illness** [updated 01-05-2024]
By the end of week 52 (ending 31 December 2023), rates of respiratory illness (influenza-like illness (ILI) and/or acute respiratory infection (ARI)) in the community continue to increase in most EU/EEA countries. Rates of severe acute respiratory infection (SARI) cases presenting to secondary care were at a level comparable to the same time last year and are now notably increasing in one of the two reporting countries.

Due to decreased testing and reporting during the holiday period, data for weeks 51 and 52 must be interpreted with caution. Seasonal influenza is circulating at higher levels than SARS-CoV-2 and respiratory syncytial virus (RSV). Influenza has continued to increase slightly from a median test positivity of 19% (pooled country data: 18%) in week 50 to 24% (pooled country data: 23%) in week 52. Of 13 countries reporting data, 10 reported seasonal influenza activity above the 10% positivity threshold in sentinel primary care in week 52. Concurrently, an increasing number of countries reported the geographical spread as widespread, indicating that influenza activity is intensifying. Influenza activity began later in 2023-2024 than in 2022-2023. Countries report a mix of increasing and decreasing trends in SARS-CoV-2 activity and COVID-19 hospitalisations, ICU admissions and deaths, with severe outcomes predominantly among those aged 65 years and above. For RSV, countries continue to report a mix of increasing and decreasing trends for activity and severity indicators. The highest impact of RSV continues to be among children aged 0–4 years.
