Coronavirus Disease 2019 (COVID-19), Influenza, & Respiratory Syncytial Virus (RSV)

Updated weekly on Tuesdays, and current as of 3:00 p.m. on the date it was posted.

**Note:** As of October 17, 2023 this document will include updates for other respiratory diseases of public health concern, primarily influenza and respiratory syncytial virus (RSV).

Additionally, the “Guidelines and Technical documents” section [last updated July 26, 2023] will no longer be updated, but is archived as an appendix at the end of this document.

Moving forward, any news and guidance updates will be cycled through the New Content section below, as always with the dates of the latest additions bolded.

This document is a collation of resources for your reference. For official guidance on COVID-19, Influenza, and RSV in Ontario, please visit the Ministry of Health (COVID-19 | The Flu | RSV).

CDC: Centers for Disease Control and Prevention | cdc.gov
- Influenza viruses spreading this season and update on JN.1 variant [01-22-2024]
- Flu vaccination coverage update [01-19-2024]
- Weekly U.S. influenza surveillance report [updated 01-19-2024]
  - Seasonal influenza activity remains elevated in most parts of the country.
After several weeks of increases in key flu indicators through the end of 2023, two weeks of decreasing or stable trends nationally have been noted. CDC will continue to monitor for a second period of increased influenza activity that often occurs after the winter holidays.

Outpatient respiratory illness has been above baseline\(^1\) nationally since November and is above baseline in all 10 HHS regions.

The number of weekly flu hospital admissions has decreased slightly for two consecutive weeks.

During Week 2, of the 727 viruses reported by public health laboratories, 591 (81.3%) were influenza A and 136 (18.7%) were influenza B. Of the 264 influenza A viruses subtyped during Week 2, 193 (73.1%) were influenza A(H1N1) and 71 (26.9%) were A(H3N2).

Seven influenza-associated pediatric deaths were reported during Week 2, bringing the 2023-2024 season total to 47 pediatric deaths.

CDC estimates that there have been at least 16 million illnesses, 180,000 hospitalizations, and 11,000 deaths from flu so far this season.

CDC recommends that everyone 6 months and older get an annual flu vaccine as long as influenza viruses are spreading.\(^2\) Vaccination now can still provide benefit this season.

There also are prescription flu antiviral drugs that can treat flu illness; those should be started as early as possible and are especially important for higher risk patients.\(^3\)

Flu viruses are among several viruses contributing to respiratory disease activity. CDC is providing updated, integrated information about COVID-19, flu, and RSV activity on a weekly basis.

- **Respiratory Virus Data Channel weekly snapshot** [updated 01-19-2024]
  - The amount of respiratory illness (fever plus cough or sore throat) causing people to seek healthcare is elevated or increasing across most areas of the country. This week, 25 jurisdictions experienced high or very high activity.

- **Severe viral respiratory illness** [updated 01-19-2024]

- **Generic protocol for ECDC studies of COVID-19 vaccine effectiveness against confirmed SARS-CoV-2 using healthcare worker cohorts, version 3.0** [01-19-2024]
- **Overview of respiratory virus epidemiology in the EU/EEA Weekly overview (week 2, 2024)** [01-14-2024]
  - By the end of week 2 (ending 14 January 2024), rates of respiratory illness (influenza-like illness (ILI) and/or acute respiratory infection (ARI)) in the community remain elevated and at above-baseline levels (based on moving epidemic method (MEM) thresholds) in most EU/EEA countries. Rates of severe
acute respiratory infection (SARI) cases presenting to sentinel secondary care remain at levels comparable to the same time last year.

- Seasonal influenza is circulating at higher levels than SARS-CoV-2 and respiratory syncytial virus (RSV). All indicators point to continued high influenza activity (all reporting countries were above the 10% sentinel primary care positivity threshold, and the majority of reporting countries observed above-baseline levels of intensity, widespread geographic spread and a third of countries exceeding medium or high ILI MEM thresholds) driven predominantly by A(H1)pdm09. There are indications of peak activity having been reached in some countries, although it is too early to conclude this for certain. Severe disease due to influenza has mainly affected people aged 15 years and above. SARS-CoV-2 and respiratory syncytial virus (RSV) were both declining in most countries.
