Coronavirus Disease 2019 (COVID-19), Influenza, & Respiratory Syncytial Virus (RSV)

Updated weekly on Tuesdays, and current as of 3:00 p.m. on the date it was posted.

Note: As of October 17, 2023 this document will include updates for other respiratory diseases of public health concern, primarily influenza and respiratory syncytial virus (RSV).

Additionally, the “Guidelines and Technical documents” section [last updated July 26, 2023] will no longer be updated, but is archived as an appendix at the end of this document.

Moving forward, any news and guidance updates will be cycled through the New Content section below, as always with the dates of the latest additions bolded.

This document is a collation of resources for your reference. For official guidance on COVID-19, Influenza, and RSV in Ontario, please visit the Ministry of Health (COVID-19 | The Flu | RSV).

Public Health Agencies

Public Health Agency of Canada | canada.ca

Beginning the week of December 6, 2021, Library Services switched from reporting daily to weekly COVID-19 trends. For daily COVID-19 case counts, you can check 2019 novel coronavirus: outbreak update, or COVID-19 vaccination in Canada for vaccination rates.

- **COVID-19 activity levels** [updated 12-05-2023]
- **Key COVID updates** [updated 12-05-2023]
  - Weekly change in cases: 10,792
  - Total cases: 4,831,665
  - Weekly change in deaths: 117
  - Total deaths: 56,291
  - Weekly tests reported: 42,135
  - Weekly percent positivity: 19.3%
- **Weekly influenza reports** [updated 12-01-2023]
  - November 19, 2023 to November 25, 2023 (week 47)
    - At the national level, influenza activity has crossed the seasonal threshold, indicating the start of influenza season. Most surveillance indicators are increasing but remain within expected levels typical of this time of year.
- **Respiratory virus report, week 47 - ending November 25, 2023** [updated 11-30-2023]
  - In week 47 (week ending November 25, 2023) in Canada, participating RVDSS laboratories reported 8,137 detections of SARS-CoV-2 from 42,135 tests (19.3% positive). Among non-SARS-CoV-2 respiratory viruses, where test volumes are lower (range of 8,423 to 28,421 tests), activity of both flu and RSV has increased in recent weeks, as is expected at this time of year.
  - In recent weeks national SARS-CoV-2 percent positivity has increased slightly, but trends vary by region.
  - At the national level, activity of influenza has increased in recent weeks, but is within expected levels for this time of year (2,143 detections; 7.5% positive). Influenza percent positivity currently varies greatly by region.
  - Activity of RSV continues to increase but is within expected levels for this time of year (1,815 detections; 6.9% positive).
  - Activity of all other non-SARS-CoV-2 respiratory viruses is low and near expected levels typical of this time of year.
  - 35/35 sentinel laboratories reported surveillance data
- **COVID-19 daily epidemiology update** [updated regularly]
- **Respiratory virus detections in Canada** [updated regularly]

BC Centre for Disease Control | bccdc.ca

- **Epi week 47: Nov 19 to 25, 2023** [updated 11-30-2023]
- **COVID-19 situation report** [updated 11-30-2023]
- **Genomic surveillance** [updated 11-30-2023]
By the end of week 47 (ending 26 November 2023), rates of respiratory illness (influenza-like illness (ILI) and/or acute respiratory infection (ARI)) in the community were increasing in many EU/EEA countries. Rates of severe acute respiratory infection (SARI) cases presenting to secondary care were comparable to the same time last year.

SARS-CoV-2 continued to circulate at higher levels than seasonal influenza and respiratory syncytial virus (RSV). Countries reported a mix of increasing and decreasing trends for SARS-CoV-2 activity and severity. Countries in the southern part of the EU/EEA are mostly in a decreasing trend while many countries in the north are in an increasing trend. Severity indicators, hospital admission, intensive care unit (ICU), and death rates continued to show an increase in week 45 or 46, especially in the 65 years and above age group; the decrease in the last 1-2 weeks potentially reflects a reporting delay. RSV activity continued to increase, with the highest impact among children aged 0–4 years reflected both in the sentinel SARI positivity and the non-sentinel hospital admissions. Seasonal influenza activity remained at a low level, although there is
Evidence of increasing intensity and geographical spread in some countries; two countries have crossed 10% positivity threshold.
