SYNOPSIS

02/10/2020

Review of “Clinical characteristics of 2019 novel coronavirus infection in China”

One-Minute Summary

- This study describes the epidemiologic and clinical characteristics of 1,099 cases of laboratory-confirmed 2019 novel coronavirus (2019-nCoV) from 552 hospitals in 31 provinces/provincial municipalities in mainland China up to January 29, 2020.
- **Male** – 58.2%; **Median age** – 47 years, with 0.9% (9/1,099) patients <15 years
- **Most common symptoms** – fever (87.9%) and cough (67.7%)
- **Median incubation period** – Three days (range 0-24)
- **Outcomes**
  - Death – 1.4%
  - Discharged – 5.0%
  - Remains hospitalized – 93.6%
  - Recovered – 0.8%
- The most common complications were pneumonia (79.1%), acute respiratory distress syndrome (3.4%), shock (1.0%) and acute kidney injury (0.5%).
- **ICU admission** was required in 5.0% of patients.

Additional Information

- **Patient exposures** were listed as follows:
  - Contact with person from Wuhan – 71.8%
  - Resident of Wuhan – 44.0%
  - Travel to Wuhan – 31.3%
  - Health care worker – 2.1%
  - Wildlife contact at Wuhan market – 1.2%
  - No link to Wuhan (not a resident, no travel history, no epi-link to a Wuhan resident) – 26.0%
- Stool samples were positive in 6.5% (4/62) of samples tested.
PHO Reviewer’s Comments

- This article has not been peer-reviewed.
- There are several instances where two different proportions are reported within the study text for the same clinical measure and it was difficult to discern which was correct.
- There are a number of inconsistencies between summary tables, figures and reported findings.
- The maximum incubation period was listed as 24 days, but there is no further discussion of this in the article. Since the study has not been peer-reviewed, the accuracy of the length of this reported incubation period is currently unclear.
- This synopsis will be updated in the event that this study is published in a peer-reviewed journal.
